National accounts of the Netherlands 2002

Statistics Netherlands

Voorburg/Heerlen, 2003

Foreword

The national accounts represent the official statistical review of the national economy. In most industrialised countries they provide the standard framework for preparing, discussing and evaluating eco-nomic and monetary policy. In the Netherlands for example, economic forecasts and analyses of al-ternative policy scenarios by the Netherlands Bureau for Economic Policy Analysis (CPB) are based on the national accounts.

Concepts and classifications of the national accounts are standardised at the world level and are laid down in international guidelines. This is important for international comparability. Because of the European unification, the need for harmonised national accounts has drastically increased in the member states of the European Union (EU). More and more, policy indicators and financial flows in the Economic and Monetary Union (EMU) and the EU are directly taken from the national accounts of the member states.

Well-known national accounts indicators are national income, volume growth of gross domestic product (GDP) and the government deficit. The government deficit as a percentage of GDP is an im-portant policy criterion in the EMU. In addition to these indicators, national accounts also show data on employment, the contribution of individual industries to GDP, developments in final consumption, fixed capital formation, etc.

The Dutch national accounts also include detailed supply and use tables, input-output tables, sector accounts, a social accounting matrix (SAM), an environmental module (NAMEA) and many detailed tables on specific transactions like taxes and social contributions. For the main macroeconomic aggregates time series are published, starting from 1900. This publication only contains annual data for the total economy. Quarterly and regional data are published separately.

Some years ago, the national accounts have been modernised, as in most of the member states of the EU. They now are harmonised with the newest international guidelines as laid down in the Euro-pean System of Accounts (ESA 1995) and the System of National accounts 1993 (SNA 1993). This gives a better picture of relatively new, economic developments like the growing importance of auto-mation, information and knowledge.

'The 'National accounts of the Netherlands 2002' contains the first complete set of national accounts data for 2002. The figures for both 2001 and 2002 are provisional.

The data presented in this publication, including the years 1969–1994, are also available in Statline, the statistical database on the Netherlands on Internet: http://www.cbs.nl. The national accounts data are in StatLine available in the form of a so-called matrix-publication, which means that the desired data can be found with the help of a search and selection machine.

The annual report 'De Nederlandse Economie 2002' is published simultaneously with the 'National accounts of the Netherlands 2002'. It signals major developments in the Dutch economy, discusses backgrounds and puts the economic and social developments in an international context. This report is available in Dutch only.

Figures in StatLine

StatLine

The data of the National accounts are also available through internet. Via this medium you can get access to StatLine, the electronic databank of Statistic Netherlands. StatLine contains statistical information on many economic subjects. The figures are available as a so-called matrix publication, i.e. the desired data can be asked for through a search or selection menu (Web-selector). The results may be consulted, printed and downloaded in the form of tables and graphs free of charge. In addition it is possible to search with key words.

How to find national accounts data in StatLine

In StatLine you will find many data on national accounts. In order to find an item very quickly you go to the opening paragraph of the homepage of Statistics Netherlands, 'www.cbs.nl'. By selecting the button figures by shifting to the right you choose the displayed menu to 'StatLine databank'. In the new screen you will find an explanation on how to obtain or select information. On the now displayed screen you will find on how you can get information or how to select.
By selecting a button on top of the page 'StatLine' you get a display which enables you to approach StatLine in two ways, namely 'Select' and 'Search' (see figure 1).
By entering an entry and then selecting "search" the search-machine of Statistics Netherlands will select a large number of tables from the StatLine databank, which displays your chosen entries.
You can also independently search in the item-tree of StatLine. This is possible by clicking on Select. The StatLine Webselector (see figure 2) will be started. By clicking on a '+' or by twice clicking on a yellow icon the underlying themes or publications are shown. The publications are shown by a blue arrow. As a next step you can make a choice from year quarter and from regional data from a number of economic items. So you can compose that selection and the tables by choosing items, classification, type of figures and periods.
In figure 2 the matrix publications are shown of the national accounts annual figures.
Figure 2 also shows an example of the matrix publication 'Macro-economic data'. In the right part of the screen items are shown as type of figures and years. By clicking '+' you can make your choice from submaps or subitems. To select several data you must press down the CTRL-button while you select.
Most data have been revised since 1969 according to the newest international guidelines. In the menu 'Years' a subdivision is made for all years (1969-2002), for actual years, (1995-2002) and last but not least the subdivision 1987 through 1994.
After your selections you can select 'Show data'. Within the selected table you still can make adaptations by mutually shifting the columns topics, type of figures and years. As a next step you can print or store the table.

A selected table can be send by e-mail to interested people. Click the button 'Link store as …..' and copy one of the URLs and import them in your E-mail with the aid of menu-choice 'Insert' and then choose 'Hyperlink'.

What national accounts data you can find in StatLine

You can find 11 matrix publications with annual data on national accounts. You find them in the main group 'Macro economy, money and capital markets'. Then you click twice the yellow icon of the subgroup 'National accounts' and by clicking the '+' of Annual National accounts the matrix publication is shown (see figure 2). The matrix publications correspond with the series in the publications National accounts of the Netherlands 2002. The relations between the StatLine matrix publications and the chapters in the publication National accounts are:

StatLine matrix publications	**National accounts chapters in the publication**
Macroeconomic data	Macroeconomic data
Goods and services	Supply, use and final expenditure
Final consumption	Idem
Groups of products	Idem
Imports and exports	Idem
Investeringen	Idem
Production process	Output, consumption and generation of income
Labour accounts	Labour
Sector accounts:	Sector accounts:
Sector data	Sector data
Financial balance sheets	Financial balance sheets
Detail data	(Sub)sector typically detail data
History National accounts	Historical data

At the moment two data matrices are available in English: Macro-economic data and Production process. The other ones will follow in the future.

Data covering longer periods can be found in the matrix publication 'Historic national accounts'. The topics GDP, wages and salaries, employers social contributions, consumption of fixed capital, imports, exports, consumption expenditures, capital formation and labour return in detail in the other matrix publications.

Quarterly national accounts data and regional figures can also be found at the subgroup 'National accounts'.

Main changes in the publication

General changes

The figures for the year 2000 are final estimates, for 2001 and 2002 they are provisional ones.

The revision 1995 has now been calculated backwards for most variables until the year 1969. The tables give figures for the years 1995-2002. In the statistical supplements a selection of the time series ispresented for the years 1969-2002.

The composition of the pages with general information has been changed somewhat. After the short table of contents a list of tables, explanations, annexes and statistical supplements has been included.

Under “Figures in StatLine” it is indicated where national accounts figures can be found in StatLine, the electronic database of Statistics Netherlands. The relation between the data matrices in StatLine and the table chapters in this publication is given as well.

For the first time the publication National accounts of the Netherlands can be found as a PDF-file on the internet site of Statistics Netherlands (http://www.cbs.nl).

Changes in the table Economic key figures of the nation

This table has been removed to the left side before the chapter Macroeconomics. The item Capital formation (gross) has been replaced by Fixed capital formation (gross).

Changes in the chapter Supply, use and final expenditure, industry and groups of products

This chapter starts now with the supply and use table for 2000.

Changes in the chapter Output, consumption and generation of income, industry

This chapter now starts with the input-output table for 2000.

Changes in the chapter Labour

New tables in this chapter are A 0.1 Labour force, 15-64 year and A 0.2 Key figures of labour. The last mentioned table presents the totals of the tables in the chapter Labour. For the tables A 1.1.1–A 1.1.2 and A 3.1.1–A 3.1.2 revised figures by industry from 1969 onwards are given. Concerning the tables A 3.1.1–A 5.4.2 no revised data are available for years before 1995.

Changes in the chapter Historical data

The revision 1995 has now been calculated backwards to the year 1969. The figures for the years 1987–1994 has been adapted. This chapter now starts with the table Supply and disposition of goods and services: indices (formerly H 6). The table numbering has been adapted.

Changes in the chapter NAM, SAM and NAMEA

For the first time figures for the most recent year are included in the SAM and in the detailed tables: Final consumption expenditure of households by type of goods and services (S 2) and Social benefits and other current transfers (S3). The NAMEA starts with the year 2000.

Changes in the Explanations

An explanation has been added about the method of deflation as used in the national accounts (Explanation 11).

Changes in the Annexes

The ESA 95 schemes of delivery have been eliminated from annex 5 (International data).

Statistical supplements

In this publication statistical supplements have been included with data for the years 1969 – 2002.

Supplement 1	The three approaches of domestic product.
Supplement 2	The main macroeconomic balancing of domestic product and national net lending or net borrowing.
Supplement 3	The main macroeconomic balancing by sectors.
Supplement 4	Domestic product and national income, alternative definitions.
Supplement 5	Generation of income by industry.
Supplement 6	Labour input by industry and sector.
Supplement 7	Labour productivity by industry.
Supplement 8	Supply and disposition of goods and services.
Supplement 9	Imports of goods and services by industry.
Supplement 10	Exports of goods and services by industry.
Supplement 11	Fixed capital formation by type of capital good.
Supplement 12	Definitions of output (basic prices) and final consumption expenditure of general government.
Supplement 13	Revenue and expenditure of general government (consolidated).

1) Excluding unfunded employee social benefits.
2) Year 2000 including revenues UMTS.
3) Discontinuity 2001-2002 concerning implementation of a new calculation method for paid interest on an accrual basis for central government.
Without break the paid interest should be 300 mln euro higher in 2002.

1) In 1999, income tax is negative. Since 1999 all reductions in wage tax due to deductibility of specific expenses are paid out directly by the tax administration as a provisional reduction in income tax.
2) Capital taxes are non-periodic current taxes on wealth. They are shown as capital transfers paid by households to general government.

1) For the years 1999-2002, income tax is negative. Since 1999 all reductions in wage tax due to deductibility of specific expenses are paid out directly by the tax administration as a provisional reduction in income tax.
2) Concerns the dividend tax from and to the rest of the world.

1) These figures are still experimental.
2) Based on COFOG. This implies that individual rent allowances are classified at the function "Social protection".
The actual individual consumption of households (see tables M 18) is classified by COICOP-functions.
This implies that individual rent allowances are classified at the function "Housing".

Explanations

1. National accounts in outlines

1.1 Introduction

The system of national accounts shows a quantitative inventory of the economic process of a country and its economic relations with the rest of the world. As part of the economic process we distinguished between production, distribution of incomes, expenditure and financing.

1.2 Economic indicators

The core in the national accounts is a number of important economic indicators such as the gross domestic product (GDP) and the national income. The GDP is a measure for the production in a country of goods and services. Roughly spoken it comes down to the difference of the value of the production and the used goods and services.

The domestic product can be determined gross or net, that is including or excluding consumption of fixed capital. This holds for the net national income as well. The national income is the sum of the primary incomes (wages, profits, on balance received interest and dividend) of the residents of a country. This equals the net domestic product plus net primary income received from the rest of the world.

1.3 Economic processes

In several countries the national accounts are only related to an estimate for one or more of these macrovariables. In that case there is no question of a description of an economic process in the above-mentioned sense. Before the Second World War this was also the case for the Netherlands; the fundamentals for an integrated system were not yet founded. In an extended system of national accounts, as currently used in the Netherlands the description goes far beyond. To start with, an extended preview is given of the production of goods and services and with that to the extent in which is provided in important vital necessities such as food, housing, durables etc. Also a description is given to what extent capital goods are written off and to what extent these through investments are enlarged. Furthermore we pay attention to the way incomes are distributed and we illustrate the redistribution of taxes and social benefits. Finally the national accounts give a description of the financial transactions. All this occurs not only for the total of the economy but also for parts of it. For example the description of the production is detailed in industries. For the description of the income distribution, expenditure and financing sectors are distinguished such as general government, households, non-financial and financial corporations.

1.4 Consistency of the description

The national accounts are called a system which is justified because they form a connected and integrated entity in which all variables are linked together in a consistent way. This contributed largely to the quality and possibilities of the use. The quality is improved because a comparison of the definitions which underlie the system makes it possible to relate the different statistics. Even when the results of these statistics do not agree, it is still possible, through integration, to come to the most plausible estimates. The use of the national accounts is improved because the systematic approach makes it possible to connect a variety of phenomena.

This systematic approach has also its limitations, especially when enforcing changes in concepts and definitions. Partial changes are without question excluded. For instance a change in production is only possible when at the same time concepts such as income, consumption, savings and investment are adapted.

In the system of national accounts estimates have to be made for a great number of variables, variables which are important in itself such as production, consumption, imports and exports, savings etc. For all these variables choices have to be made.

1.5 Uses of the national accounts

For every choice in this field a number of elements play a role. For example the consistency of the system is an important factor. Another important factor is the uses of the national accounts. The uses are rather divers. To start with: the GDP and the national income are often used as summary standards for the functioning of the economy of a country, the success of pursuing of a financial-economic policy and the financial capacity of the society. For instance net lending / net borrowing of the general government is expressed as a percentage of GDP (EMU-norm). The GDP is also one of the foundations of the contribution to the European Union. The national income is used as a guideline for the amount of the development aid and is the basis for all kind of key figures for the government. From the national accounts it is also possible to conclude the relative importance of an industry for the economy through her share in the domestic product.

Furthermore the data of the national accounts are quite often used for prognoses and analysis. Because the data give an integrated and coordinated description of the national economy they are preeminently suited for the use in models, which predict the economic development and tests the influence of policy variables. Finally the data are used in the field of the production structure. The data form a specific data base (supply and use tables and input-output tables (see explanation 3) which also serve as a basis for a very multiform application (for example for studies on energy, environment pollution and the consequences of tax policies on production and employment).

1.6 Comments on the uses

The diversity of the uses makes that the choice not always turns out to be an optimum for each use. For instance this goes for the choice between a description of the angle of incidence of the economic actors versus an account of economic processes which is as correct as possible. The first is called an institutional approach, the second a functional one. For an institutional description the producers form the core. They are classified on the basis of the main point of their economic activity into industries. For example producers who have as their main activity transport are classified in the industry transport, storage and communication. This leads to good information about the total production value of the producers which are classified into a certain industry and which join a reality in which the producer operates. However this approach at the same time means that the production because of possible side activities is part of the production value in the industry. Another example is the transport entrepreneur with retail as a sideline.

For the estimation of the total production value of a certain activity (for instance transport) the institutional approach is less suitable, the more when this side activity is practiced by producers in other industries. Here a functional approach offers more advantages. In the Dutch national accounts the institutional approach has been chosen for a number of reasons.
In this framework every choice has been directed at the aim of making the national accounts suitable for as many uses as possible. For specific intentions separate modules should be made which will contain additional data in addition to the standard national accounts and which are needed for a specific point of view or a specific use.

1.7 Perceptions of classifications

For the choice of an as general as possible usefulness another consideration might prevail. A number of concepts which appear in the national accounts (for instance “income”) also are used in bookkeeping or in fiscal terms. The meaning of these concepts is not always the same as in the national accounts. However tax figures and data from business administrations are important sources to compose national accounts. A substantial deviation of the concepts in these sources might cause a problem, both the composition of the national accounts and the use of it. More generally it applies that for a good understanding of the national accounts it is important to join as much as possible to the perceptions of the participants in the economic process.

1.8 International comparability

International comparability has already been mentioned as element in the use of the national accounts. A particular country or a national statistical office can not act independently; concepts and definitions are determined in an international context. International guidelines are provided by the United Nations, the European Union and other international organisations. In principle these guidelines are followed in the Dutch national accounts.

1.9 Prosperity

Due to the frequent and versatile use of the national accounts figures it is important that the exact meaning of these data is clear for everybody. The data about production or income, which represent the amount of available goods and services, are but one indicator for the prosperity. Prosperity or use can be defined as the satisfaction of needs of individual citizens. However, prosperity is not measurable and so is not suitable as a unit to express national accounts data. The money-units used in the national accounts are only incompletely related to the use-units, for instance because of the existence of consumer surpluses. Besides, according to many people prosperity of a society can only be expressed in terms of individual prosperity. For sure adding here is not permitted, since it is impossible to compare prosperity between individual persons. A figure such as national income cannot be a measure for collective prosperity.

1.10 Environment

In the regular part of the national accounts the environmental aspects of production and consumption are only limited taken into account. Only as far as enterprises make actual expenditure to combat pollution, these are included in the national accounts as expenses. However if the government takes care of water treatment this is seen as production by government and this contributes to the national income. This applies too in case the consumer pays. The pollution does not express itself in terms of money. However it is true that in case through the market or a democratic process a price tag is placed on environmental pollution this is taken into account in the national accounts.

The unrestricted extension of the standard description in the national accounts with environmental side effects has clearly its drawbacks. One of them is that environmental side effects should be expressed in terms of money. The information for this is by no mean satisfactory. As a consequence the accuracy of core variables like the GDP and the national income will be affected and the present uses of the national accounts are limited. It should also be noted that economic actors spending decisions are not based on an income that they should have in case an environmental damage was discounted, but on the actual income received in euros.

Still it makes sense to quantify environmental effects in statistical observable units in a separate module in connection with the national accounts (and macro-economic variables such as national income). Also for instance environmental taxes or environmental cleansing services can be differentiated in an environmental module. Such a module is included in this publication (see also explanation 8).

2. Transactions in the national accounts

2.1 Introduction

The system of national accounts describes transactions by industry and sector on the basis of international guidelines. The transactions by industry are systematically described in the supply and use tables. They focus on transactions in goods and services and on describing the production process, including income generation. The transactions by sector are systematically described in the sector accounts, which focus more specifically on income (re) distribution, use of income and financing. In this chapter, the transactions in the national accounts are further explained.

2.2 Output and generation of income (chapter Output, consumption and generation of income)

Output (basic prices)

Output covers the value of all goods produced for sale, including unsold goods, and all receipts for services rendered. Output furthermore covers the market equivalent of goods and services produced for own use, such as own account capital formation, services of owner-occupied dwellings and agricultural products produced by farmers for own consumption. The output of such goods is estimated by valuing the quantities produced against the price that the producer would have received if these goods had been sold.
Output is valued at basic prices, defined as the price received by the producer excluding trade and transport margins and the balance of taxes and subsidies on products. This is the price the producer is ultimately left with.
Some special cases:
Trade is the distribution of goods in time and space without any physical transformation. So, trade services are produced on behalf of goods. The value of these services is the difference between the sales value and the purchase value of traded goods.
Real estate activities not only include services of non-residential buildings and rented dwellings, but also of owner-occupied dwellings. The latter are valued on the basis of rents of comparable rented dwellings.
Banking mainly deals with financial intermediation, i.e. the acquisition, transformation and issuing of financial assets. The compensation for these services is implicitly included in the interest paid to and the interest received from banks. The value of these imputed bank services is calculated as the difference between property income received and interest paid.
Insurance and pension funding mainly transforms individual risk into collective risk. The value of these services is set as the difference between contributions and benefits. In the case of pension funds and life insurance companies, corrections are made for changes in actuarial reserves.
Government mainly produces collective services. Since there are no market prices available, government output is determined from production costs and is estimated as the total of intermediate consumption, compensation of employees, consumption of fixed capital and taxes on production paid by the government itself.

Intermediate consumption (purchasers' prices)

Intermediate consumption includes all goods and services used up in the production process in the accounting period, regardless the date of purchase. This includes for example fuel, raw materials, semi manufactured goods, communication services, cleansing services and audits by accountants.
Intermediate consumption is valued at purchasers' prices, excluding deductible VAT. For companies, which do not need to charge VAT on their sales, the VAT paid on their purchases is non-deductible. It is therefore recorded as a component of intermediate consumption.
Not included in intermediate consumption are:

- purchases of goods by trade enterprises, which are resold without undergoing any processing.
- purchases of goods used in the production process with a life span of more than one year. These purchases are recorded as fixed capital formation. The use of these goods is spread over their economic life span and recorded as consumption of fixed capital.

Consumption of imputed bank services

The imputed bank services produced by banks are not distributed over use categories. On the level of the total economy the use of these services is deducted from GDP (and the operating surplus / mixed income).

Value added (basic prices)

Value added at basic prices by industry is equal to the difference between output (basic prices) and intermediate consumption (purchasers' prices).

Value added (market prices)

Value added at market prices of the total economy (GDP) is calculated as follows:

	total value added at basic prices of industries
plus:	balance of taxes and subsidies on products
plus:	difference imputed and paid VAT
minus:	consumption of imputed bank services

VAT, taxes on imports, subsidies on re-exports and consumption of imputed bank services cannot be attributed to individual industries. Therefore, GDP at market prices cannot be broken down completely by industry.
Value added can be valued gross (including consumption of fixed capital) or net (excluding consumption of fixed capital).

Taxes on production and imports

Taxes on production and imports are compulsory payments to the government and the European Union (EU), which are related to production, imports and to the use of production factors.
Taxes on production and imports are classified into taxes on products and other taxes on production.

Taxes on products

Taxes on products are related to the value or the volume of products. They are levied on domestically produced or transacted products and on imported products.
Taxes on products are classified into taxes on domestic products, taxes on imports and VAT.

Taxes on domestic products (excluding VAT)

Taxes on domestic products are related to the value or the volume of domestically produced or transacted products. Examples are insurance premium tax and excise duties on motor spirits and on tobacco.

Taxes on imports (excluding VAT)

Taxes on imports are related to the value or the volume of imported products. Examples are import duties and excise duties on imported fuel.
Taxes on imports cannot be broken down by industry.

Imputed VAT

VAT is a tax on goods and services collected in stages by producers, which is ultimately charged in full to the final purchasers. Producers are obliged to hand over only the difference between the VAT on their sales and the VAT on their purchases. Imputed VAT is calculated by applying the VAT rates on the relevant goods and services. Relevant means here that VAT is only calculated on transactions of purchasers who are not able to de-

duct it. Most of the VAT is therefore recorded as being paid on final uses, mainly on household consumption. A part of VAT may, however, be paid by enterprises, mainly by those, which are exempted from VAT. These enterprises do not have to charge VAT on their sales. Therefore, they cannot deduct the VAT they have paid on their purchases of intermediate and investment goods and services. In this way the VAT is at the same time the final tax.

Difference imputed and paid VAT

Imputed VAT differs from VAT actually paid to the government. This is due to acquittals, bad debts, fines, the Regulation for small entrepreneurs and VAT evasion.
The difference imputed and paid VAT is not distributed over industries. On the level of the total economy it is added to GDP (and the operating surplus / mixed income).

Other taxes on production

Other taxes on production include all taxes on production paid by producers, not related to the value or volume of products produced or transacted. Examples are real estate tax and sewerage charges paid by producers.

Subsidies

Subsidies are current payments from the government or the EU to producers with the objective to influence output prices, employment or the remuneration of production factors. Subsidies are distinguished between subsidies on products and other subsidies on production.

Subsidies on products

Subsidies on products are related to the value or the volume of products. They can be distinguished between subsidies on domestic products and subsidies on imports.

Subsidies on domestic products

Subsidies on domestic products are related to the value or the volume of domestically produced or transacted products. Examples are EU-subsidies on food products and public transport subsidies.

Subsidies on imports

Subsidies on imports are related to the value or the volume of imported products that are re-exported without undergoing any processing. These are mainly subsidies on the re-exports of dairy products.
Subsidies on imports cannot be broken down by industry.

Other subsidies on production

Other subsidies on production include all subsidies on production paid to producers, not related to the value or volume of products domestically produced or transacted. These are mainly wage subsidies.

Compensation of employees

Compensation of employees is the total remuneration paid by employers to their employees in return for work done. Employees are all residents and non-residents working in a paid job. Managing directors of limited companies are considered to be employees; therefore their salaries are also included in the compensation of employees. The same holds for people working in sheltered workshops.
Compensation of employees is distinguished between wages and salaries and employers' social contributions.

Wages and salaries

Wages and salaries include income taxes and employees' social contributions even if they are actually withheld by the employer and paid directly to tax authorities, social security schemes and pension schemes.
Besides wages that are periodically and directly paid to employees, wages and salaries also contain extra's (such as bonuses, overtime pay, tips, commission), wages in kind (such as free housing, free food, 'company car', day nursery, lower interest rates on mortgages, free travel (or at reduced prices) and holiday allowances. Furthermore, certain refunds for costs made by the employee, such as travel expenses to and from work, are included as well.

Employers' social contributions

Employers' social contributions consist of payments to insurers made by employers for the benefit of their employees. They can be classified in employers' social security contributions, employers' private social contributions (o.w. pension schemes) and the imputed social contributions.
Most of the time the employers directly pay the employers' social contributions to the insurers. However, to show that these contributions are paid for the benefit of employees, these payments are recorded as two transactions: a) employers pay employers' social contributions to their employees, and b) employees pay the same contributions to social insurance funds.

Consumption of fixed capital

Consumption of fixed capital represents the depreciation of the stock of produced fixed assets, as a result of normal technical and economical ageing and insurable accidental damage. Losses due to catastrophes and unforeseen ageing are seen as a capital loss.
Consumption of fixed capital is calculated on the basis of the perpetual inventory method (PIM). This method starts with calculating the replacement value of the stock of produced fixed assets at the beginning of a year. This is done by correcting the value of this stock for price changes that occur in that year for comparable fixed assets. Subsequently, fixed capital formation is added and the value of discarded fixed assets is deducted from the stock. This leads to an estimation of the value of the stock of produced fixed assets at the end of the year. For each type of asset, consumption of fixed capital is calculated by dividing its average annual value by its expected life span.
This method may differ considerably from the method used to calculate depreciation in business accounts, which is based on historical costs or fiscal life span.

Operating surplus / mixed income

Gross operating surplus by industry is the balance that remains after deducting from the value added (basic prices) the compensation of employees and the balance of other taxes and subsidies on production. The operating surplus of family enterprises is called mixed income, because it also contains compensation for work by the owners and their family members.
On the level of the total economy operating surplus is computed by adding to the total of the industries the difference imputed and paid VAT and by deducting the consumption of imputed bank services.
Net operating surplus / mixed income remains after deducting consumption of fixed capital from gross operating surplus / mixed income.

2.3 Goods and services transactions (chapter Supply, use and final expenditure)

Imports and exports (valuation)

In the supply and use tables imports and exports of goods are recorded at the value at the Dutch border.
The consequences of this valuation are:

- imports of goods include the transport and insurance costs made abroad (cost-insurance-freight = cif-valuation).
- exports of goods include the transport and insurance costs made in the Netherlands (free on board = fob-valuation).

In order to assure that the balance of the exports and imports of goods and services (the export surplus) links to actual payments, which are on balance received from the rest of the world, the following rules of accounting, are handled:

- when the transport of exports in the Netherlands is carried out by a foreign freighter, the costs up to the border (included in the exports of goods) are compensated by an import of services.
- when the transport of imports in the rest of the world is car-

ried out by a Dutch freighter, the costs abroad (included in the imports of goods) is compensated by an export of services.

On the macro level imports of goods is valued free on board at the border of the exporting country. The transition from valuation of imported goods at cif to fob consists of:
- a cif/fob adjustment of the transport costs abroad of Dutch freighters. Total imports (goods) and exports (services) are reduced by the same amount.
- a cif/fob reclassification of the transport costs abroad of foreign freighters, from imports of goods to imports of services. It leaves total imports and total exports unchanged.

Imports of goods and services
Imports of goods are goods intended for residents, which are imported from abroad into the Dutch economic territory.
Included in imports of goods are raw materials, semi-manufactured products, fuels and final products. Also included are imported goods, which are re-exported without undergoing any processing.
Imports of services include among other things the expenditures abroad by Dutch tourists, inhabitants of the border area and diplomats.

Exports of goods and services
Exports of goods are goods, which have been exported by residents from the Dutch economic territory to the rest of the world.
The exports of services include the services of Dutch transport enterprises abroad, harbour services, ships repair services and engineering of works by Dutch contractors abroad.
Also included in the exports of services are expenditures by foreign tourists, inhabitants of the border area and diplomats in the Netherlands.

Final consumption expenditure
Final consumption expenditure consists of expenditure incurred by resident institutional units on goods and services that are used for the direct satisfaction of individual needs or wants or the collective needs of members of the community. Final consumption expenditure may take place on the domestic territory or abroad.
Final consumption expenditure exists only for households, NPI households and general government.

Classification of final consumption expenditure and actual individual consumption
From an international viewpoint two different classifications are applied for the final consumption expenditure and actual individual consumption are in use: according to product groups and according to objects. The classification according to product groups represents the viewpoint of the producers; this classification is also used in the supply and use tables. The classification according to objects reflects much more the viewpoint of the consumer. Here the difference between goods and services is of no importance. For instance the object transport encompasses the purchase of vehicles as well as the purchase of transport services.
In the Dutch National accounts both final consumption expenditure and actual individual consumption by households are also classifies according to goods and services categories. The specific Dutch classification can be regarded as a classification from the viewpoint of retail trade. It is really a mix of the classification according to product groups and objects.

Final consumption expenditure by households
Final consumption expenditure by households includes the following borderline cases:
- income in kind like accommodation, food, clothing etc.
- services of dwellings, which are occupied by the owners themselves and without any actual rent payments. These services are valued by applying the rents of similar dwellings.
- goods and services produced for own use, as in agriculture. The value of these products is calculated by applying the market prices for similar products.
- durable consumption goods such as private cars, household appliances, furniture and clothing. However, the purchases of dwellings by households are not seen as final consumption, but as fixed capital formation by households.

The detailed data on consumption of households concern private domestic consumption expenditure. This includes final consumption in the Netherlands by residents and non-residents. Final consumption by households can be calculated by deducting from private domestic consumption expenditure the final consumption by non-residents in the Netherlands (registered as exports) and adding final consumption by households in the rest of the world (registered as imports).

Final consumption expenditure by NPI households
Final consumption expenditure by NPI households consists of all the non-market output of this sector excluding the own account capital formation.

Final consumption expenditure by general government
Final consumption expenditure by general government results from the specific recording of government output. Only a small part of government output is actually sold (market output). The larger part of government output is paid out of public funds and provided free of charge to all sectors (non-market output). Because the allocation of government output to different users will encounter large problems, the government is by convention considered to be the consumer of its own output. Because of the absence of market prices output and final consumption expenditure by general government is calculated from the production costs:

	intermediate consumption
plus:	compensation of employees
plus:	consumption of fixed capital
plus:	other taxes on production (paid by the government)
minus:	other subsidies on production (received by the government)
=	output (basic prices)
minus:	sales (=market output)
minus:	own-account capital formation
plus:	social benefits in kind via market producers
=	final consumption expenditure by the government

Actual individual consumption
Final consumption expenditure by households refers to expenditure on consumption goods and services. In contrast, actual final consumption refers to the acquisition of consumption goods and services. The difference between these concepts lies in the treatment of certain goods and services financed by the government or NPI households but supplied to households as social transfers in kind.
By convention, all final consumption expenditure by NPI households and most of the final consumption expenditure by the government in the field of education, health, social security and welfare, sport and recreation and culture are treated as individual consumption.
So actual individual consumption is:

	final consumption expenditure by households
plus:	final consumption expenditure by NPI households
plus:	individual consumption by the government
=	actual individual consumption

Actual collective consumption
Services for collective consumption (collective services) are provided simultaneously to all members of the community or all members of a particular section of the community. Actual collective consumption consists in particular of government expenditures on services in the field of:
- management and regulation of society.
- security and defence.

law and order, legislation and regulation.
public health.
environment.
research and development.
infrastructure and economic development.

Fixed capital formation

Fixed assets are produced tangible or intangible assets that are used in the production process for more than one year.

Gross fixed capital formation consists of producers' acquisitions less disposals of fixed assets:

- acquisitions, less disposals, of tangible fixed assets:
  - dwellings and non-residential buildings.
  - civil engineering works.
  - transport equipment.
  - machinery, equipment and computers.
  - cultivated assets (trees and livestock).
- acquisitions, less disposals, of intangible fixed assets:
  - mineral exploration.
  - computer software.
  - entertainment, literary or artistic originals.
  - other intangible fixed assets.
- major improvements to land (reclamation, land consolidation and land preparing for building).

Fixed capital formation also includes:

- work in progress of construction such as unfinished dwellings, non-residential buildings and civil engineering works are recorded as fixed capital formation of the client.
- military structures and equipment, similar to those used by civilian producers, such as airfields and hospitals.
- improvements to existing fixed assets that go well beyond the requirements of ordinary maintenance and repairs.
- transfer costs of fixed assets, such as conveyance fees and costs made by real estate agents, architects and notaries.

On the level of the total economy and the sectors, an adjustment is made for the transactions in used fixed assets, which are seen as investments of the buyer and disinvestment of the seller. This adjustment is not made for the industries.

Changes in inventories

Inventories consist of all raw materials, semi-manufactured goods, work in progress and final products, that producers have in stock at a certain moment.

Changes in work in progress are in general considered to be changes in inventories. However, work in progress in construction is seen as fixed capital formation of the client and not as changes in inventories of the construction industry. This concerns unfinished buildings and civil engineering works.
Increases in inventories occur when goods are produced (or purchased) but not yet sold (or used) in the year under review. Decreases in inventories occur when goods are withdrawn from existing inventories in order to be sold or used in the production process.

The assessment of the changes in inventories is done in such way that gains or losses on inventories caused by price changes are avoided. With this objective the initial and final stock of each good is valued at the same price, namely raw materials at the average purchase price in the period, final products at average sales price and work in progress at the average cost price.
This valuation method prevents output and subsequently value added from being influenced by changes in prices of stocks during the period under review.

Acquisitions less disposals of valuables

This transaction consists of the acquisitions less disposals of precious stones, non-monetary gold, antiques, art objects and jewellery that are acquired and held primarily as stores of value. In the national accounts this transaction is mostly combined with changes in inventories.

2.4 Distributive transactions (chapter Sector accounts)

Compensation of employees

Compensation of employees is the total remuneration paid by employers to their employees in return for work done. Employees are all residents and non-residents working in a paid job. Managing directors of limited companies are considered to be employees; therefore their salaries are also included in the compensation of employees. The same holds for people working in sheltered workshops.
Compensation of employees is classified in wages and salaries and employers' social contributions.

Wages and salaries

Wages and salaries include income taxes and employees' social contributions even if they are actually withheld by the employer and paid directly to tax authorities, social security schemes and pension schemes.
Wages include payments that are periodically and directly paid to employees. Besides they contain extra's (such as bonuses, overtime pay, tips, commission), wages in kind (such as free housing, free food, 'company car', day nursery, lower interest rates on mortgages, free travel (or at reduced prices) and holiday allowances. Furthermore, certain refunds for costs made by the employee, such as travel expenses to and from work, are included as well.

Employers' social contributions

Employers' social contributions consist of payments to insurers made by employers for the benefit of their employees. They can be classified in employers' social security contributions, employers' private social contributions (o.w. pension schemes) and the imputed social contributions.
In most cases the employers directly pay the employers' social contributions to the insurers. However, to show that these contributions are paid for the benefit of employees, these payments are recorded as two transactions: a) employers pay employers' social contributions to their employees, and b) employees pay the same contributions to social insurance funds.

Taxes on production and imports

Taxes on production and imports are all taxes to the government and the EU paid by producers except for the current taxes on income and wealth.
All taxes paid by consumers are regarded as current taxes on income and wealth. So, depending on the taxpayer, the same tax is recorded as a tax on production or a tax on income and wealth. For example real estate taxes on dwellings, paid by tenants, are seen as taxes on income and wealth, while real estate taxes paid by owners of dwellings (including owner-occupiers) are seen as taxes on production.
Import duties to the EU are recorded as taxes on imports. The import duties paid by non-residents to the EU (via the government) are not recorded in the national accounts.
Taxes on production and imports are recorded according to the destination criterion. So, taxes collected by the central government on behalf of the local government or the EU are not recorded as receipts of the central government.

Subsidies

Subsidies are granted by the government and the EU to support producers, to lower the prices of their products or to increase employment. Examples are public transport subsidies, rent subsidies to owners of dwellings, EU-subsidies on food products and government contributions to loss-making public enterprises.
The subsidies on food products paid by the EU to non-residents (via the government) are not recorded in the national accounts.

Interest

Interest only refers to actual payments and therefore all forms of calculated interests - like interest upon reserves or provisions - are left aside. Payments on loans by public enterprises to the government institution to which they belong are recorded as withdrawals from income of quasi-corporations.

Interest is imputed to the period for which the underlying claim or debt has been set.

Dividends
Dividends are a form of property income received by owners of shares to which they become entitled as a result of placing funds at the disposal of corporations. Dividends are recorded gross, before deduction of dividend tax. This applies also for the taxes on dividends to and from the rest of the world.
Dividends are recorded at the moment they are made payable.

Withdrawals from income of quasi-corporations
Quasi-corporations have no independent legal status. However, they have an economic and financial behaviour that is different from that of their owners and similar to that of corporations. Therefore they are classified as non-financial or financial corporations.
So, public enterprises are seen as corporations, although they belong to the government. The profits of these enterprises are transferred to the government in the form of 'withdrawals from income of quasi-corporations'.
However, government contributions to loss-making public enterprises are recorded as subsidies.

Reinvested earnings on direct foreign investment
Reinvested earnings on direct foreign investment are equal to:

	operating surplus of the direct foreign investment enterprise.
plus:	property income and current transfers receivable.
minus:	property income and current transfers payable, including actual remittances to foreign direct investors and any current taxes payable on income and wealth of the direct foreign investment enterprise.

Property income attributed to insurance policy holders
In the national accounts pension and life insurance provisions are seen as a liability of insurance enterprises to policyholders. Therefore, the investment revenues on these provisions are booked as payments from insurance enterprises to households.
Subsequently, households pay back these revenues as imputed contributions to pension funds and life insurance companies. In the financial accounts the latter transaction is recorded as a component of net equity in life insurance and pension funds reserves.

Income from land and subsoil assets
Income from land and subsoil assets includes rents (received by landowners from tenants) and royalties for the permission to explore or to extract minerals or fossil fuels (received by owners of such deposits).

Correction imputed bank services
In the national accounts, the output of imputed bank services is calculated as the difference between property income received and interest paid by credit institutions (excluding investment trusts). Therefore, imputed bank services influence the value added of credit institutions. However, received property income and interest paid also show up on the income account of credit institutions. To avoid double counting an item 'correction imputed bank services' is introduced on the resource side of this account.

Current taxes on income and wealth
Current taxes on income and wealth of corporations consist of corporation tax and dividend tax. These taxes are based on the profits of corporations.
Current taxes on income and wealth of households include all taxes, which are periodically imposed on income and wealth, such as the income tax, the wage tax, and the tax on net wealth of individuals. Non-periodical levies, such as inheritance tax are defined as capital transfers. Several types of taxes are simultaneously seen as taxes on production and imports when imposed on producers, and as taxes on income and wealth when imposed on consumers. E.g. motor vehicle tax is a tax on production when it is imposed on company cars and it is a tax on income and wealth and imports when it is imposed on cars for private use.

The treatment of dividend tax results from the recording of dividends. Because dividends are recorded gross, i.e. before deduction of dividend tax, dividend tax is in all cases recorded at the receiving sector. The same applies for the dividend tax to and from the rest of the world.

Social contributions
Social contributions include social security contributions, private social contributions (o.w. contributions to pension schemes) and imputed social contributions. Employers, employees, self-employed persons and non-active persons pay these contributions.
Actually, the employers' part is paid directly to the insurers. However, in the national accounts, the employers' contributions are supposed to be part of primary income of households (i.e. the income from direct participation in the production process). Therefore, in first instance these contributions are treated as payments by employers to households as compensation of employees, who are deemed to pay them to the insurers in the income account.

Social security contributions
These are contributions from households to social security funds.

Contributions to pension schemes
Contributions to pension schemes are based on collective contracts with pension funds and life insurance companies.
The contributions are calculated as follows:

	actual contributions to pension schemes (gross)
minus:	compensation of insurance services (part of consumption of households)
plus:	supplement from investment income
=	contributions to pension schemes

The supplement from investment income is part of the property income attributed to insurance policyholders that relates to pensions.

Other private social contributions
These are contributions paid to private social schemes excluding pension schemes. The contributions to these schemes can be derived in the same way as the contributions to pension schemes.

Imputed social contributions
Imputed social contributions represent the counterpart to the 'unfunded employee social benefits' (less any employees' social contributions) paid directly by employers to their (former) employees. It is necessary to introduce this imputation because the direct payments are recorded twice. Firstly they are recorded as employers' social contributions (part of the compensation of employees). Secondly they are recorded as social benefits.

Social benefits
Social benefits are transfers to households, intended to relieve them from the financial burden of a number of risks or needs, such as sickness, invalidity, disability, old age, survivors and unemployment.
Social benefits are classified in social security benefits, social assistance benefits, private social benefits (o.w. pension benefits) and unfunded employee social benefits.

Social security benefits
Social security benefits are paid by social security funds, in the field of unemployment, disability, sickness, old age etc.

Social assistance benefits
Social assistance benefits are payments of the central and local government to households, for which no quid pro quo by the beneficiary is expected. These benefits are based on a number of Dutch laws, such as the National Assistance Act and the Social Employment Act.

Pension benefits
Pension benefits are private social benefits in the field of old age, survivors or disability, paid by pension funds and life insurance companies.

Other private social benefits
These are benefits paid by employers out of special reserves, which are segregated from their other reserves.

Unfunded employee social benefits
These social benefits are directly paid by employers to their (former) employees, without involving any social security fund. Examples are the continuation of wages in case of illness, military pension provisions and reimbursement of medical expenses (for civil servants).

Non-life insurance premiums
Non-life insurance premiums comprise both the actual premiums payable by policyholders to obtain insurance cover during the accounting period, and the premium supplements payable out of the property income attributed to insurance policy holders, after deducting the compensation of insurance services. These premiums provide cover against damage as a result of fires, floods, crashes, collisions, sinkings, theft, violence, accidents, sickness, etc.
As the compensation of insurance services of non-life insurance enterprises is calculated by subtracting the claims from the premiums (actual premiums and premium supplements), it follows that the total non-life insurance premiums must equal the total non-life insurance claims of the insurance enterprises.

Non-life insurance claims
Non-life insurance claims represent the amounts which insurance enterprises are obliged to pay in settlement of injuries or damage as a result of fires, floods, crashes, collisions, sinkings, theft, violence, accidents, sickness, etc.

Other current transfers n.e.c.
This transaction includes all transactions not mentioned before, which do not have the character of a capital transfer. This concerns particularly the current transfers within the general government.

Adjustment for net equity in pension funds reserves
Since households are treated in the financial accounts as owners of the pension funds reserves an adjustment item is necessary to ensure that any excess of contributions to pension schemes over pension benefits does not affect household savings:

	contributions to pension schemes
minus:	pension benefits
=	adjustment for net equity in pension funds reserves

This adjustment is also made for the claims of non-residents on the reserves of Dutch insurance companies.

Capital transfers
Capital transfers are payments for which no quid pro quo by the beneficiary is expected. They burden the wealth of the payer, or are meant to finance fixed capital formation or other long-term expenditures of the receiver. Capital transfers can be classified into investment grants, capital taxes, other capital transfers and imputed capital transfers.

Investment grants
Investment grants are capital transfers, which are intended to finance fixed capital formation of other units.

Capital taxes
Capital taxes are compulsory, non-periodical payments to the government. They are based on the wealth of taxable persons. In practise, they only cover the inheritance tax. Taxes on net wealth of individuals are imposed periodically and are therefore recorded as taxes on income and wealth.

Other capital transfers
Other capital transfers are capital transfers that cannot be characterised as investment grants or as capital taxes.

Imputed capital transfers
Contributions by the government meant to increase the pension schemes reserves are recorded as other capital transfers of the government to insurance corporations and pension funds. Subsequently, these amounts are imputed to households by way of an imputed capital transfer from the insurers to the policyholders. Eventually, the amounts are paid back to the insurers as a component of the change in the net equity of households in the pension schemes reserves (financial transaction).

Acquisitions less disposals of non-produced non-financial assets
Acquisitions less disposals of non-produced non-financial assets mainly consist of sales of land by public (municipal) development corporations to investors in dwellings and non-residential buildings. The valuation of sales and purchases of land is exclusive of VAT and transfer costs. These are included in fixed capital formation.

2.5 Financial transactions (chapter Sector accounts)

General
Financial transactions are changes in financial assets and liabilities to other sectors and the rest of the world. In general, these changes in assets (or liabilities) are measured as the difference between provided (or attracted) financial resources and redemptions. However, the value of transactions in securities such as shares and bonds is determined as a balance of all purchases (in the case of changes in assets) and as a balance of all sales (in the case of changes in liabilities). Revaluations, for example as a consequence of changes in exchange rates, are not recorded as financial transactions.

Financial transactions may have the following causes:
- the financial transaction is the consequence of a current or a capital transaction. Both transactions are recorded at the same moment against the same value.
- the financial transaction is the result of another financial transaction. Both transactions are also recorded at the same moment against the same value.

In grouping the financial transactions, efforts have been made to combine two points of view:
- the character and the form of the relevant transactions. In this way a picture arises of the developments of a number of market segments for the money and capital market.
- the maturity and transferability of assets and liabilities. This is important for judging liquidity and solvability of a sector.

Monetary gold and special drawing rights
Monetary gold includes all gold, which is not intended for industrial purposes and not held in the form of valuables. By convention monetary gold is seen as a liability of the rest of the world. Monetary gold can only be held by DNB.
The special drawing rights (SDR's) consist of the international reserve assets created by the IMF. As a financial asset, this transaction only exists for the Dutch Central Bank (DNB).

Currency
Currency consists of notes and coins in circulation that are commonly used to make payments. As a liability, this transaction only exists for the central government (issuing of coins), the monetary financial institutions (DNB, issuing of bank notes) and

the rest of the world (foreign currency). The deposits on smart cards etc. are not part of the currency.

Transferable deposits
Transferable deposits include all deposits in euro's and foreign currency with resident and non-resident banks which are repayable on demand, immediately and without restriction by cheque, standing order or by other means (deposits on smart cards).
As a liability, this transaction only exists for monetary financial institutions and the rest of the world.

Savings deposits in euro's
These savings deposits include all deposits in euro's of both residents and non-residents in the form of normal saving accounts, fixed saving accounts, premium saving accounts and fixed-term saving accounts.

Other deposits
Other deposits include all deposits in euro's and foreign currency at any resident and non-resident bank (except for saving deposits in euro's), which are not immediately transferable without restrictions. As a liability this transaction only exists for monetary financial institutions and the rest of the world.

Bills and short-term bonds
Bills and short-term bonds are all securities with a maximum term of one year, which in principle are transferable against a price that has been fixed in advance. Usually, the obliged interest payments of the debtor have been discounted in the value. 'Transferable' means that assets can be converted into cash from, or on a date that has been appointed at the moment the bond was issued.

This transaction covers treasury paper issued by both the Dutch government and foreign governments, saving certificates to bearer and transferable certificates of deposits, issued by banks.

Long-term bonds
Long-term bonds are all transferable securities, which generally do not mature within one year. They are usually quoted at the stock exchange. The interest on long-term bonds is made payable through coupons. Mortgage bonds, notes issued by banks and convertible bonds as long as they have not been converted into shares, also belong to this type of assets.

Short-term loans
Short-term loans are all credits, which do not have the characteristics of deposits and which mature by contract within one year. Included are short-term loans from financial institutions, balances on current accounts (except transferable deposits), short-term consumer credit, bills (of exchange) and promissory notes.

Long-term loans
Long-term loans are all credits, which do not have the characteristics of deposits and which do not mature within one year. They mainly concern long-term loans on obligations, mortgage loans and long-term consumer credit.

Shares and other equities
Shares and other equities are all claims, which are -fully, or partly- entitled to a share in profits or in the own funds in case of liquidation. Included is the value of capital formation by the government in public enterprises (quasi-corporations) that belong to the government.

Net equity of households in pension funds reserves
The net equity of households in the pension funds reserves of resident pension funds and life insurance companies is seen as a financial asset that belongs to resident and non-resident households.

The net equity of households in the pension funds reserves is built up as follows:

	actual contributions to pension schemes (gross)
minus:	compensation of insurance services (=consumption)
plus:	supplement from investment income
=	contributions to pension schemes
minus:	pension benefits
plus:	imputed capital transfers
=	net equity of households in pension funds reserves

Net equity of households in life insurance reserves
The net equity of households in the life insurance reserves of resident and non-resident pension funds and life insurance companies is seen as a financial asset that belongs to resident and non-resident households.

The net equity of households in the life insurance reserves is built up as follows:

	actual life insurance contributions (gross)
minus:	compensation of insurance services (=consumption)
plus:	supplement from investment income
=	life insurance contributions
minus:	life insurance benefits
=	net equity of households in life insurance reserves

Other insurance technical reserves
Other insurance technical reserves are financial assets of the beneficiaries that may belong to any sector. They consist of:
- prepayments of insurance premiums i.e. premiums payable in the current accounting period intended to cover risks outstanding during the following period.
- reserves for outstanding claims held by insurance corporations in order to cover the amounts they expect to pay out in respect of claims that are not yet settled.

Other accounts receivable and payable (net)
The transactions in the sector accounts are mainly recorded at a moment that does not coincide with the moment the transaction is completed. These time differences cause changes in assets and liabilities, which are recorded in the transaction 'other accounts receivable and payable'.
For example, sales are recorded at the moment of delivery. At that moment, a claim of the supplier on the buyer (suppliers credit) arises, which is nullified when the buyer pays. Other examples are payments in advance on deliveries (buyer's credit) and due payments or receipts of wages and salaries, interests, contributions etc.
Due to lack of sufficient information, it is impossible to distinguish for any of the sectors the changes in assets on one hand and the changes in liabilities on the other hand. Therefore this transaction is recorded as a 'net' liability for all sectors.

2.6 The balancing items in the sector accounts

Domestic product / value added
Value added (basic prices) by sector is equal to the difference between output (basic prices) and intermediate consumption (purchasers' prices).
The total value added at basic prices of all sectors plus some transactions which cannot be attributed to sectors, is equal to total income generated in the Netherlands or gross domestic product (GDP). The undistributed transactions include taxes less subsidies on products and consumption of imputed bank services.

National Income / primary income
Part of GDP flows to the rest of the world (wages and salaries to non-resident employees, interests and dividends to non-resident financiers), while income generated in the rest of the world is transferred to the Netherlands. National income is the sum of GDP and net primary income from the rest of the world.

Disposable income

Disposable income is the balancing item of the secondary distribution of income account. It shows for each sector its disposable income, which remains after the redistribution of primary income by compulsory or non-compulsory current transfers between the sectors.
Total disposable income of all resident units is called disposable national income, which is equal to national income plus net current transfers received from the rest of the world.

Saving

Saving is the difference between disposable income and final consumption expenditure.
In the national accounts households are treated as owners of life insurance and pension funds reserves. Since contributions to pension schemes and pension benefits are recorded in the secondary income account, an adjustment item (adjustment for net equity in pension funds reserves) on the use of income account is necessary to ensure that any excess of contributions to pension schemes over pension benefits does not affect household saving.

Surplus of the nation on current transactions with the rest of the world

The surplus of the nation on current transactions consists of:

- net exports, the difference between exports and imports of goods and services.
- net primary income from the rest of the world: compensation of employees, taxes on production and imports, subsidies and property income, such as interest and dividend.
- net current transfers from the rest of the world, such as dividend tax, social security benefits and other current transfers.

The surplus of the nation on current transactions deviates from the surplus on the current transactions according to the Balance of payments on a transaction basis drawn up by Dutch Central Bank (DNB), in co-operation with Statistics Netherlands. The discrepancies between the two balancing items are caused mainly by differences in definitions and measurement.

Net lending (+) or net borrowing (-)

Net lending (+) or net borrowing (-) shows the amount a sector can lend / invest or has to borrow, given the current and capital transactions in the sector accounts.

Changes in financial net worth

Changes in financial net worth as established from the financial transactions, equal all changes in financial relations of one sector with other sectors or with the rest of the world. Basically, this balance equals net lending (+) or net borrowing (-). However as a consequence of using various sources for current and capital transactions and for financial transactions statistical discrepancies will appear.

3. Supply, use and input-output tables

3.1 Introduction

This publication presents a supply table (table G 0.1), a use table (table G 0.2) and an input-output table (table P 0.1) for 2000. Below an explanation is given of the contents of these tables; also the mutual relations are shown.

3.2 Supply table

The supply table (table G 0.1) describes the supply of different kinds of product. A distinction is made between domestic output by industry (column 1-25) and imports (column 27).

A row in the supply table describes the supply of a particular product. For example cell 1,1 shows the output of agricultural products of agriculture. Cell 1,27 shows the imports of these products.

A column in the supply table describes the total output of an industry by kinds of product. For example column 3 shows the output of the food industry of food products, metal products, business services and contract workers etc.

3.3 Use table

The use table (table G 0.2) describes the use of different kinds of product. A distinction is made between intermediate consumption by industry (column 1-25) and final expenditure (column 27-32). Final expenditure is broken down into exports, final consumption expenditure by households, final consumption expenditure by general government, gross fixed capital formation and changes in inventories.

A row in the use table describes the destination of each product. For example cell 1,3 shows the intermediate consumption of agricultural products by the food industry. The export of these products is recorded in cell 1,27.

By definition, the total of each row in the use table (column 35) is equal to the corresponding row total in the supply table (column 32). Some additional columns are introduced in order to make up for the differences that result from different valuation methods applied in the supply and use tables (see 3.5).

A column in the intermediate section of the use table shows the products used (row 1-45) and the value added generated (row 48-52) in the production process of an industry. For example cell 47,3 shows the total intermediate consumption of the food industry. The gross value added of this industry (at basic prices, see 3.5) can be found in cell 53,3. The total of each column in the use table (row 58) equals by definition the corresponding column total in the supply table (row 46).

3.4 Input-output table

Supply and use are also shown in the input-output table (table P 0.1). However, there is no break down by product, but by industry of origin and by imports. This discloses the relations between suppliers and users. The input-output table is derived from the supply and use tables.

A row of the input-output table represents the output by industry, broken down by category of destination: intermediate consumption by industry and final expenditures. A column in the intermediate section shows from which industries (or imports) the intermediate consumption of an industry originates. For example cell 1,3 shows the intermediate consumption of products of agriculture by the food processing industry, while total imports of that industry is shown in cell 28,3.

The input-output table also contains value added by industry (row 34-40) and final expenditure by industry of origin (column 27-32). The output of trade and transport margins is recorded in column 33. This column equals to row 45 of the supply table. A full allocation of margins by industry is not possible, since it is generally unknown which products are involved and which destination they have. Therefore, trade and transport margins are recorded in a separate row (32) and a corresponding column (33) (see 3.5).

3.5 Valuation

For domestic products there are three kinds of valuation. The *purchasers' price* is the price of a product paid by the purchaser, excluding VAT. However, the producer of the product receives a lower amount. The difference is made up by the trade and transport margins on products. The amount received by the producer is called the *producers' price*. However, when the producer pays taxes on products (such as excises) or receives subsidies on products, he is ultimately left with the so-called *basic price*.

For imported products there are two kinds of valuation, *purchasers' price* and *cif-price*, the price at the Dutch border.

Valuation types of domestic output

	purchasers' price
minus:	trade and transport margins
=	producers' price
minus:	taxes on products
plus:	subsidies on products
=	basic price

Valuation types of imported products

	purchasers' price
minus:	trade and transport margins in the Netherlands
minus:	taxes on imports
plus:	subsidies on imports
=	cif-price

The three types of tables in this series are valued differently.

In the *use table* domestic output and imports are valued in *purchasers' prices.*
Non-deductible VAT is entered in a separate row (row 46).

In the *supply table*, domestic output is valued at *basic prices* and imports at *cif-prices*.
The totals for trade and transport margins and taxes and subsidies on products can be found in column 29, 30 and 31. In this way, the total of each product in the supply table equals the corresponding total in the use table.
Row 47 and 48 of the supply table show the taxes and subsidies on products by industry. By definition, the totals of these rows are equal to the corresponding column totals (30 and 31).

In the *input-output table*, domestic output is valued in *producers' prices* and imports at *cif-prices*.
Trade and transport margins on purchased goods are shown in row 32. In row 29 the taxes on imported products are recorded; import duties are included here. Finally, row 30 contains the subsidies on re-exports.

3.6 Relation between use table, input-output table and macro-totals

Some rows and columns have been added to the use table and the input-output table in order to link them to the macro-aggregates.

Sales of used fixed capital goods

The stock of fixed capital goods will be increased by purchases of newly produced and imported fixed capital goods and diminished by sales of used fixed capital goods. Sales are recorded in the column 'fixed capital formation'. The counter-entries are exports, in case of sales to the rest of the world, or final consumption expenditure by households, in case of sales to households. Imports of used fixed capital goods have been completely allocated to fixed capital formation.

Final consumption by non-residents in the Netherlands

Private final consumption expenditure in the Netherlands also includes consumption by non-residents, for example their holiday expenditures in the Netherlands. These expenditures are excluded from final consumption expenditure by households with the help of a correction in one entry. A counter-entry is made under exports.

Final consumption by households in the rest of the world

The opposite of consumption by non-residents in the Netherlands is the final consumption by Dutch households in the rest of the world. Final consumption expenditure by households has been adjusted for these expenditures. In a separate column 'final consumption by households in the rest of the world' a counter-entry has been made on imports.

Net exports of goods, which have not crossed the frontier n.e.c.

Residents buy or sell goods in the rest of the world, which are not actually imported into or exported from the Netherlands. The other way round, non-residents buy or sell goods in the Netherlands, which are not actually exported or imported. On a separate row the balancing item of all these transactions is recorded as exports; the counter-entry is changes in inventories.

Difference between paid and imputed VAT

Non-deductible VAT is estimated on the basis of underlying transactions and charged tariffs. This VAT-amount, called the imputed VAT, must be transferred by the enterprises to the central government. However, the actual receipts by the government are not equal to this amount due to fines, discharges, acquittals and bad debts. The non-paid VAT is added to the operating surplus in a separate column called 'paid minus imputed VAT'. Therefore, the total of row 'non-deductible VAT' is the amount received by the government.

Consumption of imputed bank services

The imputed bank services produced by banks are not distributed over use categories. On the level of the total economy the use of these services is deducted from GDP (and the operation surplus / mixed income).

The tables in this publication are highly aggregated. More detailed supply and use tables and input-output tables are available on application (see the colophon). The tables have been compiled both in current prices and prices of the previous year.

4. Sectors in the sector accounts

4.1 Introduction

The sector accounts present in successive accounts a review of all economic processes, like production, income distribution and financing. These accounts are not only compiled for the national economy as a whole, but also for different domestic sectors. In this way the sector accounts describe:
- for each economic process the role of each sector, e.g. general government in the income redistribution and credit institutions in financing.
- for each sector all economic transactions and their relation with other domestic sectors and the rest of the world.

Five sectors are distinguished: non-financial corporations, financial corporations, general government, households and NPI households. These sectors are clarified in section 4.2.
In the supply and use tables and the input-output tables producers are classified by industry. The relation between sectors and industries is explained in section 4.4.

4.2 The sectors in the sector accounts

The sector accounts describe the transactions of Dutch economic units with other economic units, Dutch as well as foreign. The Dutch economic units include all corporations established in the Netherlands, all Dutch government institutions in the Netherlands and abroad and all resident natural persons.
Corporations contain all incorporated enterprises and some unincorporated enterprises. Examples of these unincorporated enterprises (quasi-corporations) are public transport companies and large family enterprises. Foreign enterprises settled in the Netherlands are also considered as Dutch corporations. On the other hand affiliates of Dutch enterprises in foreign countries are not recorded as Dutch corporations.
All corporations and quasi-corporations only pertain to the sectors non-financial corporations and financial corporations.

Non-financial corporations

The sector non-financial corporations consists of all (quasi-) corporations which are principally engaged in the production of goods and marketable non-financial services.

Non-financial corporations include:
- all corporations, quasi-corporations and co-operative organisations which do not belong to the financial corporations.
- all NPI households which do not pertain to the other sectors. Examples are old people's homes, hospitals and housing corporations.
- public enterprises, which are fully or partly owned by the government, like Dutch Railways (NS).

Financial corporations

This sector consists of all (quasi-) corporations which are principally engaged in intermediation (acquisition, transformation and distribution of financial means) and insurance (conversion of individual into collective risks).
This sector consists of three subsectors: monetary financial institutions, insurance corporations and pension funds and other financial institutions.

Monetary financial institutions include:
- the Dutch Central Bank (DNB).
- banks which are legally obliged to report to DNB due to supervisory legislation. This group includes general banks, savings banks and mortgage banks.

Insurance corporations and pension funds include:
- all institutions under supervision of the Insurance Supervisory Board like pension funds, life and non-life insurance enterprises and saving funds.
- institutions not under supervision of the Insurance Supervisory Board like Early Retirement funds and reinsurance corporations.
- privately organised social insurance institutions. These institutions execute social insurance schemes outside the sphere of influence of the government, like the Riskfund for construction and various medical health arrangements for specific professional groups like local civil servants and policeman.

Other financial institutions include:
- investment trusts.
- institutions, which do not have to report to DNB, like autonomous financing and lease companies, municipal credit banks, regional development companies.
- financial auxiliaries like the Amsterdam Stock Exchange, the European Option Exchange, credit card organisations and credit and mortgage intermediation services.
- financial auxiliaries like insurance agents, guarantee funds, pension consultancies and insurance exchanges.
- holdings of monetary financial institutions, insurance corporations and pension funds, which are not under supervision themselves.

Not included in the sector financial corporations are:
- legally autonomous investment trusts which are held by one or more owners, who themselves do not belong to any financial corporation. These are included in the sector to which the owner belongs.
- non-supervised pension funds aimed at pension insurance of one single person. These are included in the sector households.
- unincorporated financial auxiliaries. These are included in the sector households.

General government

The sector general government consists of all units, which mainly are controlled and financed by the government. These units consist only of non-market producers. All Dutch government institutions belong to this sector, even if they are active abroad, like embassies. On the other hand foreign embassies and international institutions, like Europol and the International Court of Justice, do not belong to the Dutch government. Corporations form no part of the government sector, even when they are partly or fully owned by government institutions, as is the case for the Dutch Railways (NS), Amsterdam Airport (Schiphol) or the Central Bank (DNB).
The general government sector is split up into three subsectors: central government, local government and social security funds.

Central government includes:
- the state (ministries and some budget funds like the Municipal Budget Fund, the Province Budget Fund, the Mobility Fund and the Infrastructure Fund).
- universities.
- public corporate organisations like commodity boards.
- a group of national foundations and organisations.

Examples of national foundations and organisations are:
- research institutions linked to universities.
- charity, relief and educational organisations that are controlled and mainly financed by the government (NOVIB).
- privatised national government services.
- other institutions such as the Open University.

Local government includes:
- provinces and district water boards.
- municipalities, excluding their quasi-corporations like public transport companies.
- joint ventures of municipalities in the field of waste processing, water treatment, fire brigades, social work provision etc.
- privatised government services like employment service offices and regional police forces.
- local private law institutions, like schools for special education, museums, public libraries, the Youth Work Guarantee Plan and asylums.

Social security funds include:
- supervisory and executive bodies for social security regulations like the Supervisory Board for Social Insurance, the Social Security Bank, the Medical Insurance Board, industrial insurance boards and Industrial Insurance Administration. Starting with 1998 they also encompass the people, employed by the central government, who are covered by statutory disablement regulations, including the implementation organisations.
- social security funds for the execution of the Compulsory Pension Funds Act, the Unemployment Insurance Act, etc.

Households
The sector households consists of all natural persons who are resident for more than one year in the Netherlands, irrespective of their nationality. On the other hand Dutch citizens who stay abroad for longer than one year do not belong to the Dutch sector households.
The sector households does not only cover independently living persons, but also persons in nursing homes, old people's homes, prisons, boarding schools etc.
If persons are entrepreneurs, their business also belongs to the sector households. This is the case for self-employed persons and owner-occupiers of dwellings. On the other hand, large autonomous unincorporated enterprises (quasi-corporations) are included in the sector non-financial or financial corporations.

NPI households
The sector NPI households consists of foundations and clubs whose resources are principally derived from voluntary contributions from households and from property income. Examples are religious organisations, charity organisations, political parties, trade unions and cultural, sports and recreational organisations.

4.3 The relation between sectors and industries

Below, the content of the sectors in the sector accounts is compared with the contents of the industries in the supply, use and input-output tables.

Non-financial corporations
The sector non-financial corporations consists of all economic units which are not included in other sectors.

Financial corporations
The sector financial corporations consists of all economic units in the industries banking, insurance and pension funding and activities auxiliary to financial intermediation, except financial units that are not under supervision and work for a non-financial corporation in which they participate.
This sector also includes other industries, such as:
- operational lease companies belonging to a financial institution (industry renting of movables).
- holdings of monetary financial institutions, insurance corporations and pension funds, which are not supervised themselves (industry legal and economic activities).
- employers' organisations, trade unions and professional organisations linked to financial institutions (industry other service activities n.e.c.).

General government
The sector general government includes all the units in the industries public administration and social security, defence activities and subsidised education. The government also encompasses units, which belong to other industries such as:
- specific activities of municipalities as cleansing services (industry sewage and refuse disposal services), social workshops (industry other manufacturing), medical services (industry health and social work activities) and joint ventures of municipalities for these activities.
- employment service offices and the Youth Work Guarantee Plan (industry activities of employment agencies).
- research institutions linked to universities (industry research and development).
- non-commercial activities of the Dutch Railways (industry supporting transport activities).
- reception centres for e.g. people seeking asylum (industry health and social work activities).
- charity, relief and educational organisations (industry other service activities n.e.c.).

Households
The sector households consists of all natural persons including their business activities (self-employed people and owner-occupiers of dwellings). Owner-occupiers are part of the industry real estate activities. In principle, self-employed people can occur in every industry, except for the industries, which carry out specific government activities.

NPI households
Foundations and clubs, which belong to the sector NPI households, can be found in the industries health and social work activities, recreational, cultural and sporting activities and other service activities n.e.c.

5. Accounts in the sector accounts

5.1 Introduction

Sector accounts present a coherent review of all economic processes and the roles played by the various sectors. Each economic process is described in a separate account. The accounts describe successively production, primary and secondary income distribution, final consumption, redistribution by means of capital transfers, capital formation and financing.

The accounts register economic transactions, distinguishing between uses and resources, with a special item to balance the two sides of each account. By passing on the balancing item from one account to the next a connection is created between subsequent accounts.

These accounts do not only exist for the total economy, but they are also compiled for separate domestic sectors. In this way the sector accounts describe:
- for each economic process the role of each sector, e.g. general government in the income redistribution and credit institutions in financing.
- for each sector all economic transactions and their relation with other domestic sectors and the rest of the world.

The accounts of 'transactions of the rest of the world with the Netherlands' are the mirror image of the accounts for the national economy. They are presented from the point of view of the rest of the world and contain only a current account, a capital account and a financial account. The current account includes imports, exports and income transactions.

The successive accounts are explained in more detail below.

5.2 The accounts

Production account
The production account shows the transactions, which are related to the production process. The output is registered as a resource, the intermediate consumption as a use. The balancing item of this account for the individual sectors is gross value added at basic prices.

The production account of the total economy is the total of the production accounts of the sectors plus the transactions for which there is no sectoral distribution available (taxes and subsidies on products, consumption of imputed bank services). The balancing item of the production account for the total economy is GDP at market prices.

Income account: generation of income
This account describes the transactions by means of which the value added at basic prices is distributed to labour (compensation of employees), capital (consumption of fixed capital) and government (the balance of taxes and subsidies on production). The balancing item of this account is the operating surplus. The balancing item for the sector households is called mixed income, because apart from operating surplus it also contains compensation for work by self-employed persons and their family members.
Net operating surplus / net mixed income remains after deducting consumption of fixed capital.

Income account: primary income distribution
This account records as uses the income from direct participation in the production process as well as property income received in exchange for the use of financial resources, land and other intangible assets. In addition, this account records the taxes on production and imports received by the government. On the resources side the paid property income is registered, as well as the subsidies paid by the government.

On this account the interest actually paid and received is registered. This includes imputed bank services. However, these services have already been recorded in the output (and therefore in the operating surplus) of credit institutions. To avoid double counting a negative item 'correction imputed bank services' is introduced on the use side of this account of the sector credit institutions.
In the national accounts insurance technical reserves are seen as a liability of insurance enterprises and pension funds to policyholders. Therefore, the receipts from investing these reserves are booked as payments from insurance enterprises and pension funds to households, in the form of property income attributed to insurance policy holders.

The balancing item of this account for each sector is primary income. The primary income for the total economy is the national income.

Income account: secondary income distribution
The secondary income account shows how primary income is redistributed by means of current taxes on income and wealth, social contributions (among which contributions to pension schemes), social benefits (among which pension benefits) and other current transfers.

The balancing item of this account is disposable income. For the consuming sectors (households, NPI households and general government) this item is passed on to the use of income account. For the other sectors the disposable income is equal to savings. This is passed on to the capital account.

Income account: use of income
This account shows which part of disposable income is spent on final consumption and which part is saved. As mentioned above final consumption only exists for households, NPI households and general government.

The net equity of households in pension funds and life insurance reserves is seen as a financial asset that belongs to households. Changes in these reserves need to be included in the savings of households.
However, contributions to pension schemes and pension benefits have already been recorded on the secondary income account (as social contributions and social benefits). Therefore, an adjustment is needed to include the change in pension funds reserves on which households have a definite claim, in the savings of households. This adjustment is called 'adjustment net equity in pension funds reserves'.
There is no need for a similar adjustment concerning life insurance because life insurance premiums and benefits are not recorded as current transactions.

Capital account: capital transfers
On this account the capital transfers are recorded.

Capital account: capital accumulation
On this account gross fixed capital formation, changes in inventories, acquisitions less disposals of valuables and non-produced non-financial assets are recorded among the uses. The decline in the value of fixed capital goods caused by consumption of fixed capital goods is recorded among the resources.

The balancing item is net lending (+) or borrowing (-). It shows the amount a sector can lend / invest or has to borrow given the current and capital transactions in the sector accounts.

Financial account
The financial account of a sector provides a detailed review of the change in the financial relations with the other sectors and the rest of the world. Therefore the financial account is a logical extension

of the current and capital accounts. The financial relation between a sector and the other sectors and the rest of the world can be broken down into assets and liabilities, both with a large variety of financial titles. Change in the assets and liabilities are financial transactions.
Theoretically, the balancing item of the financial account, 'change in financial net worth', is equal to 'net lending / net borrowing'. However, due to the use of different sources, statistical discrepancies occur.

5.3 Statistical discrepancies

The sector accounts can give a complete and fully consistent description of the total economy. Consistency implies that:

- a transaction that is recorded as a use in one sector is recorded as a resource in another sector and vice versa. Consequently, for each transaction the total of uses equals the total of resources. This is called the transaction-identity. A special case is the identity of total supply (output and imports) and total use (intermediate consumption, final consumption expenditure, capital formation and exports).
- all available means of a sector are also used by that sector. This is called the budget-identity. This identity implies that, theoretically, for each sector total resources and change in liabilities equals total uses and change in assets.

In the sector accounts the transaction-identity is fully satisfied. However, it is not yet possible to meet the budget-identity. Maintaining this identity would require adjustments of the estimates, which cannot be justified by the available data sources. For this reason there has been chosen to allocate statistical discrepancies to the financial accounts.

6. NAM

6.1 Introduction

The sector accounts do not show detailed data on the production process and the supply and use of goods and services. On the other hand, supply and use tables do not present a review of economic processes like income distribution and financing. So both the sector accounts and the supply and use tables fulfil a specific function in the national accounts.

The National accounting matrix (NAM) presents the whole system of national accounts in one, overall framework. A presentation in the form of a matrix is obvious, especially because it allows the inclusion of supply and use tables. Furthermore, a matrix presentation offers the possibility to choose for each constituent part of the economic process the most relevant type of unit and the most relevant classification of units. In this way, it becomes possible to show the relations between the different kinds of transactions in the economy.

6.2 An aggregated NAM

Table N 1 shows an aggregated NAM for 2002. This table gives a good overview of the relations between the macro economic aggregates. For example, the relations between the main domestic and national economic indicators like gross domestic product (GDP), net national income (NNI), disposable income and the surplus of the nation on current transactions can be derived directly from this table. Details of the table are further discussed below.

In the table receipts are recorded in the row and expenditures in the column. For each account the totals of the rows (receipts) and the corresponding columns (expenditures) are equal. If an account results in a balancing item, this item is usually recorded in the column of that account. The value of this balancing item is equal to the receipts in the row minus the expenditures in the column. E.g. gross domestic product is the balancing item of the production account and equals output (cell 2,1) less intermediate consumption (cell 1,2).

Supply and use

Account 1 shows the goods and services transactions. Here the macro-estimates are recorded, concerning the supply and use of goods and services valued at purchasers' prices. The different categories of the use of goods and services are recorded in the row: intermediate consumption, final consumption expenditure of government and households, changes in inventories, fixed capital formation and exports of goods and services (fob). For the total economy, the balance of paid and received trade and transport margins (cell 1,1) is always nil. However, these margins will appear in more detailed tables such as the supply and use tables.

The column of account 1 shows the supply: each product has been produced by a domestic industry (cell 2,1) or has been imported (cell 13,1). Output of industries is valued at basic prices, that is, excluding the balance of taxes on products (VAT and excises) and subsidies on products. Taxes less subsidies on products are part of the primary income of the government (cell 4,1) or the rest of the world (cell 13,1). The total of the first column equals total supply, valued at purchasers' prices. Subsequently, the first row and column totals are equal by definition.

Production

Account 2 represents the production account. The link with account 1 is given by the output by industries (cell 2,1) Production costs are recorded in column 2. These consist of intermediate consumption of domestic and imported goods and services as well as the value added. The latter is broken down into primary cost categories.

Together both accounts represent the aggregated supply and use tables; the supply table, however, has been transposed. A more detailed elaboration of the supply and use table can be found in section 3.

Generation of income

Account 3 distinguishes some value added categories (wages and salaries, operating surplus etc.). In this account, GDP is recorded in the column of the production account and is subsequently increased with wages and salaries earned abroad by Dutch residents (cell 3,13) and decreased by wages and salaries paid to non-residents (cell 13,3).

The part of VAT that has been imputed but not paid is part of the output and GDP at basic prices. This has been added to the operating surplus, which is shown in cell 3,3. After the recording of consumption of fixed capital in the capital account and the other taxes less subsidies on production received by the rest of the world in the current account of the rest of the world, a new balancing item remains in cell 4,3, which is called Net National Generated Income. NNGI represents the total income, which resident units have earned by their direct participation in the production process.

Allocation of primary Income

Account 4 describes the distribution of primary income for the sectors. They receive NNG and the property income from the rest of the world (cell 4,13). Property income transactions between domestic sectors affect only the distribution of national income, not its level (cell 4,4). The same holds for property income imputed to insurance policy holders, an imputed payment from insurance enterprises to households.

On this account, the government receives the balance of taxes on products and subsidies on products (cell 4,1) and VAT on land (cell 4,10). The other taxes less subsidies on production (exclusive of the part that belongs to the rest of the world) are included in the share of the government in NNGI (part of cell 4,3). Property income paid to the rest of the world must be subtracted (cell 13,4) in order to arrive at NNI at market prices.

Redistribution of income and consumption

Account 5 shows the redistribution of national income by current transfers (such as taxes, social contributions and benefits), part of which flow from and to the rest of the world. The Dutch economy is to a large extend influenced by the redistribution of income. For example, income transfers in cell (5,5) are of the same magnitude as total NNI (cell 5,4). Account 5 is balanced by net disposable national income.
Account 6 shows the use of income. Disposable income, which results from the secondary distribution of income, is used for final consumption and net saving (column 6).

Capital transactions

Account 7 describes the capital account for all sectors. In the row, capital income is recorded such as consumption of fixed capital, net savings and received capital transfers (inheritance taxes, investment grants and the like) from other sectors and the rest of the world. The column presents all capital expenditures such as fixed capital formation, changes in inventories, net purchases of land (on macro-level zero) and capital transfers, paid to other sectors and the rest of the world. This results in national net lending (+) or net borrowing (-).

Special treatment of fixed capital formation

In order to provide a better understanding of the role of fixed capital in the economy, some separate accounts are introduced in the NAM, which differ mainly in type of classification.
By the current presentation of fixed capital formation in the NAM, three problems can be singled out. Firstly, although the current na-

tional accounts contain estimates of total fixed capital formation by sector and by industry, it is not clear which sector invests in which industry. Secondly, the distribution of fixed capital formation by destination is not available for the individual product groups. Finally, even though the destination of the newly produced and imported capital goods is known for each industry, this does not go for the existing capital goods, which are traded within the Netherlands.

The destination of these goods is only known by sector. Therefore, a so-called dummy account (account 8) has been introduced. A dummy account has no further break down, even in a detailed presentation of the NAM. Fixed capital formation is recorded by sector on the row of this account, according to the capital account of the sectors. The column shows in cell (1,8) the changes in inventories by product group and in cell (9,8) the fixed capital formation from production and imports (which are new for the Netherlands), specified by industry of destination. Cell (10,8) represents the sales of existing, but not yet fully written-off, capital goods, as far as they are exported or purchased by households for consumptive purposes.

Account 9 presents the destination of fixed capital formation. Fixed capital formation by industry is recorded in the row. In the column, fixed capital formation is shown by industry, broken down by type of asset.

In account 10, fixed capital formation is recorded by type of asset (buildings, means of transport, machinery and the like). A breakdown according to their industry can be found in the row. In the column these assets are distinguished according to the corresponding product groups.

Summarised, this presentation opens the possibility to show relations between the fixed capital formation by sector (as shown in the sector accounts) and by product group as shown in the supply and use tables).

Financial transactions

Accounts 11 and 12 contain the financial accounts for the sectors. The financial accounts start with the national net lending (+) or net borrowing (-) item from the capital accounts. Ideally, the account is balanced for each sector but for statistical reasons there are discrepancies, which are included in the change in financial assets (cell 12,11). For a comprehensive explanation of the statistical discrepancies, see explanation 4.

The change in liabilities (cell 11,12) concern the entering into new obligations, such as contracting of loans, issue of shares etc., minus repayments of existing liabilities. Change in financial assets (cell 12,11) concern the net acquisitions of financial titles (e.g. by lending money or purchasing shares and bonds). The sales of existing financial assets are recorded with a negative sign. For a further explanation of the financial accounts see explanation 4. In account 12, the financial assets and liabilities are recorded, which have been generated or sold in the year under review, including transactions by the rest of the world with the Netherlands.

Transactions with the rest of the world

Account 13 describes the current transactions with the rest of the world. This account has been drawn up from the foreign perspective. The current transactions from the rest of the world are recorded in the column; in the row the transactions to the rest of the world are reviewed. However, the surplus of the nation on current transactions is considered from the Dutch point of view. This means that the balancing item is recorded on the row of the current transactions account of the rest of the world and in the column of the capital account of the rest of the world. In case of a surplus on the current account (of the Netherlands vis-à-vis the rest of the world) a positive result is recorded here. In contrast with the other balancing items in the NAM, this item is not recorded in the column but in the row of the accounts.
Finally, account 14 shows the capital transactions from the rest of the world with the Netherlands and is, as a consequence, also drawn up from the foreign point of view.

7. SAM

7.1 Introduction

In the National Accounting Matrix (NAM) the core system of the national accounts is represented in a matrix format. One of its features is its opening to selecting the best suitable units for every constituent part of the economic process. This allows for flexibility, which implies that the matrix can be extended as required to one's needs. The Social Accounting Matrix (SAM) is an example of such an extension, in which the emphasis is put on the role of individual persons and households in the economy.

The core system of national accounts provides a good overview of important economic aggregates. However, not all information relevant for evaluating economic performance can be found in this system such as employment, distribution of income, spending patterns etc. Although this type of information is often available on a meso-level, it usually has not been included into one macro-framework. The SAM has been developed in order to fill this gap.

In the SAM, relations are established between the supply and use table (with its emphasis on production and income generation) on the one hand and the sector accounts (with their emphasis on the distribution of income, expenditures and on financing) on the other. The main goal of the SAM is to provide information about different categories of labour and households. This manifests itself in a breakdown of the household sector and a detailed presentation of the labour market. Hence, an integral description of the circular flow of income on the meso-level originates, fitting consistently into the macro-economic context.

For the compilation of the SAM, three statistical systems have been used: the national accounts, the labour accounts and the socio-economic accounts. The labour market data in the SAM are based on the labour accounts; detailed information on households is taken from the socio-economic accounts. The three statistics have been combined in such way that the resulting system is consistent with the national accounts figures.

The labour market is portrayed by distinguishing employees by gender and (seven levels of) education. For each industry wages and salaries, employment and wage rates are included, broken down into fourteen labour categories. In this way insight is gained in the use of labour by industry as well as the supply of different kinds of labour by groups of households.

The households themselves have been distinguished into fourteen categories. This breakdown is based on their main source of income and on the composition of the household. For a comprehensive review of the classifications applied in the SAM, we refer to Occasional Paper NA/68.

7.2 A brief description of the SAM

Even though the SAM contains a large amount of detailed socio-economic information, its structure is nearly identical to the NAM. For that reason, in this description only issues important to the SAM are emphasised, especially the role of households in the economy.

As in the NAM, receipts can be found on the row and expenditures in the column of the matrix. Most accounts are closed with a balancing item, which as a rule is shown in the column of the account. In this way the totals of the rows and columns of each account are equal and a consistent system emerges.

Table S 1 shows the SAM for 2002. The table has been aggregated in order to provide a clear overview. In the case of the production factor labour, the number of education levels has been reduced to two. Only four household categories are shown in the table. The category other households contains the transactions of institutional households like residents of old people's homes. Also, all transactions, which could not be allocated to individual households and adjustments that had to be made in order to link with the system of national accounts, have been recorded here.

Supply and use

The first two accounts of the SAM together make up the supply and use tables. In the case of the SAM, a further break down of household consumption expenditure is especially important. In this way, the consumption patterns of different household categories can be shown. This illustrates the extra dimension a SAM can add to the standard information as shown in the national accounts. Accounts 1 and 2 are followed by accounts describing the generation of income, the distribution of income and the use of income. These accounts are in fact the core of the SAM.

Generation of income

The generation of income account describes the generation of value added and its allocation over the different production factors. The factor payments for labour are particularly important in the SAM. They are recorded as a transaction (work in exchange for money) between employer (classified by industry) and employee (classified by gender and education). In the SAM data on paid employment (i.e. the number of employees converted into full-time equivalent jobs) are included, both by kind of labour and by industry. The balancing item of this account is net national generated income. For the different categories of households this represents the income they have generated by their active participation (as employee or own-account worker) in the production process.

Allocation of primary income

The allocation of primary income account describes the distribution of value added over all participants (i.e. the suppliers of the production factors labour and capital) in the production process. It is shown how wages and salaries of employees end up at those households to which they belong. This provides a statistical description on how the labour market (where individual employees are active) is related to different households groups. This information opens the door to further research on the dependence of the different household groups on demand and compensation of the different kinds of labour.

Furthermore, for each sector and for each household group the receipts and expenditures of property income are recorded by counter sector. Receipts generated from investment in net equity kept in portfolio by life insurance and pension funds but owned by households, are considered as primary income of households in the national accounts.

The balancing item of the account is the primary income for each category of households and all other sectors. These items add up to the national income at market prices.

Redistribution of income and consumption

The distribution of secondary income account shows the redistribution of income. The consequence of government policy on disposable income of household groups is shown here. The balancing item is disposable income by household group.

For each household group, consumption and savings are shown in the column of the consumption account, thereby linking income, consumption patterns and production.

Special treatment of taxes

The row of the tax account shows the link between taxes and the transaction on which each tax is levied. For example, the amount of taxes on income and wealth and social contributions paid by each household category are shown in the tax account. In the column, the receipts of the taxes and contributions are specified.
In table S 1, a partly aggregated matrix is shown as an overview. Unfortunately, this results in a limited view of the amount of information that can be extracted from a SAM. The detailed version of the SAM offers a much better understanding of the interrelations between the transactions of a large number of household groups, product groups, industries and the like.

8. NAMEA

8.1 Introduction

In the national accounts, it is a matter of principle that the value of a product or merit payment corresponds with what has been paid or received for it in reality. In this way receipts and outlays always equal each other, which guarantees the consistency of the complete system. This valuation principle reveals market preferences for private products and the democratic preferences for public services. The registration of environmental pollution in the national accounts is in accordance with this principle. If environmental damage is not actually charged to the polluter, it should not have any influence on national income. After all, these social burdens are not deducted from the compensation of employees and stock-owners in these establishments and in addition household consumption will not have decreased. Similarly, a free use of certain environmental functions - like swimming in a clean sea - will not lead to an increase in national income.

Although the national accounts core system might contribute to the understanding of the development of a welfare society, it does not draw up a complete picture of the actual situation. Besides the unpaid consumption of environmental functions, the national accounts do not give any insight in e.g. unpaid household work and leisure time. On the other hand, such aspects of welfare as national income, employment and social security benefits can be derived from the system of national accounts. However, they are not combined in some kind of adjusted national income. Non-monetary aspects of welfare can be embedded in a comprehensive information system from which for every aspect an individual indicator can be drawn.

In the 'National Accounting Matrix including Environmental Accounts' (NAMEA) a link has been established between the national accounts and environmental statistics. The NAMEA discloses the interrelation between macro-indicators for the economy (net domestic product, net saving, external balance etc.) and the environment. The NAMEA can function as an instrument for all kinds of analysis. As an example, indirect economic and environmental effects of consumption or export of certain products can be demonstrated. The NAMEA can also be used as a framework in an applied general equilibrium model. As such, the framework can be used to calculate the consequences of e.g. energy levies on environmental themes (like greenhouse effect) and economic indicators (such as domestic product and national income). Another possible application of macro economic models is the estimation of a national income in a sustainable situation in which domestic product has been maximised, where at the same time a number of technical and economical constraints are satisfied and (on top of that) on the restriction that the pollution does not exceed certain targets.

Statistics Netherlands has published detailed NAMEAs for the years 1987-1992. In that publication the following themes are considered: the greenhouse effect, ozone layer depletion, acidification, eutrophication, waste, wastewater and the exploration and exploitation of crude oil and natural gas. More recent data are available on request.

The next few years Statistic Netherlands will be working on a further development of the NAMEA, both conceptually and in figures.

8.2 A brief description of the NAMEA

The NAMEA consists of a conventional National Accounts Matrix (NAM), extended with two accounts on the environment: a substance account and an account for environmental themes. These accounts do not express transactions in monetary terms but include information on the environment as it is observed in reality: that is, in physical units.

In the NAMEA not only pollution caused by producers and consumers is shown, but also the entry of polluting substances in the Dutch environment: the domestically emitted pollution including the balance of cross-border pollution from and to the rest of the world. Cross-border pollution exists of two different parts, i.e.:

a. pollution by non-residents in the Netherlands or by residents abroad.
b. supply and removal of pollution by surface water or air.

For the greenhouse effect and the ozone layer depletion only contribution by residents to these global environmental problems is shown in the tables NE 1 and NE 2. Table NE 3 explains for a number of emissions to air how this contribution is related to total pollution on Dutch territory. In this respect, it is important to notify that road, water or air transport can be carried out by various industries (and households). For example, civil aviation can almost completely be attributed to the activity ‘air transport’ while military aviation carried out by defence is part of public administration.

The other accounts in the NAMEA contain, in an aggregated form, the usual transactions of the NAM. However, in a number of cases, the receipts and outlays with a typical 'environmental character' have been singled out and reported separately, e.g. the environmental cleansing services in the goods and services account. Like in the NAM, in the NAMEA the receipts are registered on the row and the outlays in the column. Most accounts are balanced: the balancing item being the totals of the receipts minus the outlays. This item has been shaded in the column of the account concerned. In this way the totals for the rows and columns are equal for all accounts and a consistent system emerges. In table NE 1 an aggregated presentation of the NAMEA is shown. This table is an aggregation. In most accounts of the detailed NAMEA a number of categories have been distinguished.

In the goods and services accounts intermediate and final use of goods and services is shown in the row while the supply, originating from domestic production and imports can be found in the column. Environmental cleansing services are shown separately. These consist of both external and internal services. External cleansing services are services furnished by one production unit to another or to a final expenditure category. In the national accounts they are seen as production, intermediate consumption or final expenditure. The collecting and processing of waste by the environmental cleansing services is an example. The internal services are services produced by production units for own use. In the national accounts they are not seen as production and intermediate consumption. However, in order to get an idea of the financial efforts by the different industries for the environment, they have been included in the NAMEA. Though both production and intermediate consumption in the NAMEA are higher then in the conventional national accounts, domestic product and all other balancing items are not affected. In the column of the goods and services accounts, taxes on products (VAT, excises etc) and trade and transport margins can be found. Together they form the difference between the outlays of the buyer and the receipts of the producer.

In a specific consumption account the consumption expenditures of households are re-allocated to consumption purposes. The latter are connected to specific pollution patterns. Consumer goods that are purchased in order to protect the environment are presented separately. This concerns, for example, the extra costs of cars fitted with catalytic converters. These costs reflect, together with the environmental taxes paid by households, an indication of the financial efforts by households on behalf of the environment.

The production account shows on the row the production of goods and services and the related emissions of polluting substances. The column contains, except for intermediate consumption, consumption of fixed capital and net value added, data for a number

of inputs in the production process measured in physical units for which in fact no payment has been made. These concern extraction of natural resources in the Netherlands but also waste reprocessed in incineration plants and wastewater in the wastewater treatment plants.

In the tax account environmental taxes are represented separately. This includes for example consumer taxes based on environmental pollution and other levies on pollution as presented in the tables D 0.2 and D 0.4 of this publication.
The relations with the rest of the world are treated in two accounts, a current account and a capital account. The row of the current account presents imports, not only of goods and services, but also of polluting substances which enter the Netherlands through rivers, air and cross border transport activities. In the concerning column the expenditure of the rest of the world as well as the export of polluting substances can be found. The figures in the current external balance of the rest of the world with the Netherlands show for most of the polluting substances that exports exceed imports.

On the row of the substance account final destination of total pollution is shown. Part of it ends up in the rest of the world. Pollution, which is re-absorbed in the economic process, is shown separately. In a similar way, the extraction of natural resources is shown. The remaining pollution is re-allocated according to a number of environmental themes: the greenhouse effect, the depletion of the ozone layer, acidification, eutrophication, accumulation of waste and wastewater. The depletion of natural resources has been summarised into one joint theme for crude oil and natural gas. In the column of the substance account the origin of the pollutants is registered. This pollution is caused by producers, consumers and the rest of the world. Subsequently, this column registers a number of changes in natural resources such as new discoveries or changes in economic reserves due to fluctuating market prices. Next to the annual extraction, these factors determine the initial and final stocks.

The so-called 'environmental themes' in the NAMEA are represented in a separate account. The concept of the themes has been adopted from the (second) Netherlands' 'National Environmental Policy Plan' where they are used as an integrating framework of current environmental problems in the Netherlands. In this account for every substance its contribution to the environmental themes is shown. These data are converted into so-called theme-equivalents. The weights reflect for each theme the potential relative stress of each substance on the environmental theme under consideration. This method has been developed by the Department of Housing, Regional Development and the Environment and is largely based on international research on the effects of different substances on the quality of the environment.

This method yields only a limited number of physical environmental indicators. The indicators for the greenhouse effect and the depletion of the ozone layer monitor the Netherlands' contribution to these global themes. The other themes can be seen as national themes, where the environmental damage within the country is at stake. For these themes, domestic pollution is augmented with the imports, and reduced by the exports of pollutants.

9. Labour

9.1 Introduction

In recent decades the statistical observation of persons, administrations and enterprises as well as central registrations has been expanded regularly. Through this much more information has become available about the different aspects and areas of the labour market. In order to provide a coherent and consistent overview, Statistics Netherlands has set up an integrated system of data on labour, called the Labour Accounts. The data refer to uniformly delineated populations according to uniform classifications and are based on clear definitions and the identity relationships these bring about. These data are generated in a statistical integration process that leads to the most accurate estimates possible on the basis of the available information.

The major sources used by the Labour Accounts are the Survey on Employment and Earnings, the quarterly statistics on Employed Persons, the Labour Force Survey and the social security files.

The Labour Accounts has been revised in 1999. The revision of the Labour Accounts is synchronised with the 1995 revision of the National Accounts, leading to a full fit between the two with regard to compensation of employees and full-time equivalent jobs. The compensation of employees (the Labour Accounts terms this employee costs) is published in the chapter Supply, production and final expenditure, the full-time equivalent jobs in the chapter Labour.
The revision has also been used to process new statistical sources and changes that occurred in existing sources since the start of the Labour Accounts (1987). Also, the revision made it possible to introduce some improvements, such as the inclusion of third jobs.
Because estimates focus on getting the best year-on-year changes, discrepancies with actual levels gradually emerged over the years. The revision has made an end to these increasingly larger discrepancies from 1987 and onwards.

In 1999 revised data from 1995 onwards were published. The revision has now been calculated backwards until 1987, with the exception of the data in the tables A 3.3.1 through A 5.4.2. The chapter Labour contains a number of labour market aspects. The tables only represent a small part of the data produced by the Labour Accounts. More detailed data can be provided on request. StatLine, the statistical database set up by Statistics Netherlands also has more information available.

9.2 Labour force

Employed labour force
The employed labour force consists of persons in the age category 15-64 working at least 12 hours a week.

Unemployed labour force
The unemployed labour force consists of persons in the age category 15-64 who have accepted work for at least 12 hours a week, or willing to work at least 12 hours a week, who are available and actively seeking work for at least 12 hours a week.

9.3 Employed persons

Employed persons are all persons having a job in business units or private households residing in the Netherlands. Both self-employed persons as well as employees belong to the employed persons.

Employed persons are all those who:
- are paid for work, even if they work for one or a few hours a week.
- are paid for work that is withheld from the registrations of the tax and / or social insurance authorities, but which in itself is legal.
- are temporarily out of work (due to illness, bad weather) but who continue to receive their salary.
- have taken a temporarily unpaid leave.

Employees / self-employed persons
Employed persons are categorised into employees and the self-employed persons. Employees are all persons who receive wages or salaries.
The self-employed persons work for their own company or in their own profession on their own account and risk. The family members of the self-employed also belong to this category unless they have a labour contract.

9.4 Jobs

A job is a working place occupied by an employed person. Because employed persons can have more than one job, the number of jobs is higher than the number of employed persons. When a job is only filled for part of the year it is counted for that part. The number of jobs in a year is an average.

Type of employment: full-time job / part-time job
A full-time job concerns a full day or week task. All other jobs are part-time jobs.

Type of contract: fixed job / flexible job
Flexible jobs are jobs held by employees who work for temporary employment agencies, who do labour on request (on call labour, substitute labour) or who have other jobs with irregular working hours. All other jobs are fixed jobs.

Main job / secondary job
If a person has more than one job, the main job is the job on which he or she spends most of the time. Any other job is a second or third job.

9.5 Labour input

Full-time equivalent jobs
For employees the fulltime equivalent of a job is the quotient of the annual contractual hours for the job and the annual contractual hours considered full-time in that branch of industry.
For self-employed persons the fulltime equivalent of a job is the quotient of the usual weekly working hours for that job and the average weekly working hours of self-employed persons with a weekly number of working hours of 37 or more in the same branch of industry.

Hours
The labour input of employees expressed in hours is the total number of hours of all employees during the reporting period. The Labour Accounts use various concepts of working hours; contractual hours, hours overtime and hours paid.

Contractual hours
Contractual hours are the hours agreed in the contract between employer and employee. Included are sickness hours; excluded are holidays and various other days off.

Hours overtime
Hours overtime are extra hours worked in excess of the contractual hours, and which have been paid in full.

Hours paid
Hours paid are defined as the contractual hours plus the hours overtime. Holidays and other days off are not considered paid, in contrast with the legal terminology. The payment received for these days is attributed to other days.

In future the Labour Accounts will also publish the labour input in terms of hours worked. The difference between hours worked and hours paid mainly lies in the hours not worked due to health or weather problems.

9.6 Further details

The number of persons employed, jobs and the labour input are also classified according to economic activity, sex and working hours.
The classification of employed persons by economic activity occurs on the basis of the Dutch 1993 Standard Industrial Classification (SBI 1993) according to the enterprise where they are on the payroll. So, people working for temporary employment agencies are classified under temporary employment agencies etc.

9.7 Payment of employees

The Labour Accounts distinguishes *gross employee income*, which approaches wages and salaries as income from the employees' point of view, and *employee costs*, which reflect the employers' costs, related directly to employing the individual in the production process.

The gross employee income and the employee costs are set up in the Labour Accounts starting from the concept used in the business wage administration namely gross wage recorded for social insurance reasons. This includes:
- wages in cash (including continued payments of wages in the event of sickness, excluding disability benefits).
- payments in kind considered being wage income by the tax authorities (not including company cars).
- tips.

The employee contributions to pension and early retirement schemes and the employers' social contributions are not included.

Gross employee income
Gross employee income is defined as the wages before deduction of income tax and social contributions payable by the employee. It includes the remuneration for the work done and the continued payments of wages in the event of sickness or weather problems etc. And it can be divided into regular wages paid each week or month, and special payments. The special payments usually occur only once a year, such as bonuses, holiday allowances and profit sharing.

Employee costs
The Labour Accounts' concept of employee costs is identical with compensation of employees in ESA 1995. Important differences between employee costs and gross employee income are:
- commuter transport compensation, which are costs for the employers but no income for the employees.
- employers social contributions which are costs for the employer and no income for the employees.

10. Some breaks in the time series

10.1 Introduction

Data in the national accounts are estimated in such a way that they are comparable with data for contiguous years, thus reflecting year to year changes as accurately as possible.
Only at periodic revisions levels are updated and newly computed. Data for previous years are also adjusted then in order to retain comparability in time. In spite of aiming at comparability in time, discontinuities sometimes occur, mostly as a result of revisions, which are not fully calculated back in time. This results in a number of breaks in the tables in the chapter Historical data.
Besides changes in tax legislation, social security regulations, etc. may have a significant effect on the continuity of the time series.

10.2 Time series breaks caused by revisions

Statistics Netherlands has been compiling economic data since the 1930s. Later on, these data became part of the national accounts. 'Official' figures have been available since 1900. In due time the availability of new data sources, improved estimation techniques and new concepts have led to a number of national accounts revisions. In first instance, a revision is applied to one year for which simultaneously two data sets are compiled: one set according to the old methods and concepts and a second set according to the new ones. Subsequently, recalculations are carried out for a number of preceding years.

The number of years to be recomputed, however, differs for each revision. The long time series are therefore split into sub periods, which are not mutually comparable. In the time series, all figures in break years are given twice: before and after the revision concerned. For volume and price figures, the problem of break years can be avoided to some extent by presenting only changes relative to the preceding year and not indices related to a fixed base year.

In order to make possible long-term comparisons of volume and prices, table H 6 shows for a number of benchmark years indices based on 1938=100. They haven been calculated by cumulating the annual mutations from previous tables.

For the estimation of the national income a number of different methods have been applied. The first one is the income method. The incomes of individual units are aggregated to a national total. These incomes are mainly based on fiscal data. The second is the net-production method. Here for every individual industry its production and its intermediate consumption are determined through production data, based on industrial surveys. The difference between production and intermediate consumption is the value added. The national income is the sum of the value added of all industries, after an adjustment for primary income transactions with the rest of the world. The third method is the commodity-flow or input-output method. This method too is based on estimates of production and intermediate consumption; however in this case production and intermediate consumption by industry are detailed in goods and services groups. For each and every goods and service group should hold that the production of an industry should be supplied to either the other industries or to final expenditure categories. The other way around the intermediate consumption by each industry of each group of goods and services should originate from the production by a domestic industry, imports or the decrease of inventories. These identities between 'available' and 'used' opens the possibility to make detailed confrontations and to determine for each industry its production, intermediate consumption and value added in such a way that the results are consistent with those for other industries. Of all the methods mentioned above the commodity-flow method is the most reliable.

For 1900-1920 only national income data have been calculated, applying the income method. Volume data were obtained by deflating with a consumer price index for working-class families. The concepts used then deviate from those currently in use. For details we refer to the publication 'Berekeningen over het nationale inkomen van Nederland voor de periode 1900-1920' (Speciale Onderzoekingen van de Nederlandsche Conjunctuur, No. 4, 1941).

A couple of years ago data for the period 1921-1939 have been revised, as much as possible in accordance with the concepts currently in use. Here the net-production method has been applied. Several variables, like expenditure categories have been estimated autonomously. Deflators are calculated on the basis of detailed data. Details can be found in the publication 'The Dutch economy, 1921-1939 and 1969-1985. A comparison based on revised macro-economic data for the interwar period'.

For the years 1940-1945 the same method has been applied as for 1900-1920. The data and methods have been published in 'Statistische en econometrische onderzoekingen', nieuwe reeks, jaargang 5, 1^{e} kwartaal 1950. For 1940-1945 only national income (net, factor costs) data are available (see the publication National accounts of the Netherlands 1999). The volume data too concerns the concept of factor costs. For the sake of continuity this concept has also been upheld for 1946-1948. For 1946 and 1947 the commodity-flow method has been applied. At several points the concepts used deviate from the modern ones. Besides that, later revisions have not been calculated backwards. For more details we refer to the publication 'De Nationale Jaarrekeningen: doeleinden, problemen, resultaten' (Monografieën van de Nederlandse Conjunctuur, no. 8, 1950).

For the years after 1948 the commodity-flow method has been applied. The original data for the period 1948-1957 have been published in 'Statistische en Econometrische Onderzoekingen', 2^{e} en 3^{e} kwartaal 1958, those for 1958 and after have been published in the annual publications of the national accounts.

The data for the years from 1948 onwards contain some discontinuities. In the first place the 1977 revision was calculated backwards no further than to 1969. This revision is described in the publications 'Nationale rekeningen 1980' and 'Nationale rekeningen 1969-1981 met herziene reeksen voor de jaren 1969-1976'.

In the second place, a revision was carried out for the benchmark year 1987, see 'Nationale rekeningen 1991, volume II'. The 1987 revision was calculated backwards until 1969, the figures are given in the publications 'Nationale rekeningen – gereviseerde reeksen 1977-1986' and 'Nationale rekeningen – gereviseerde reeksen 1969-1976'.

In the third place, revised data for the years 1995-1998 were presented in the National accounts 1998. Since then the Dutch national accounts are in accordance with the newest international guidelines: the European System of Accounts (ESA 1995) and the System of National Accounts (SNA 1993). A detailed description of the 1995 revision is presented in the publication 'Revision Dutch National Accounts: first results and backgrounds'. This revision has now been calculated backwards until 1969.

10.3 Effects of recent government measures

A number of changes, introduced recently in the field of taxes and social security have had important effects on the continuity of national accounts data. A few important changes are mentioned below.

Operation social housing

In 1995, the government redeemed specific long-term liabilities towards housing corporations. The redemption sum was based on the present value of liabilities and amounted up to 14,9 billion euro. In the national accounts, this is recorded as a capital transfer from the government through non-financial corporations. In 1995, this led to a sharp increase in net borrowing of the government while at the same time net lending of non-financial corporations rose to the same extent. Housing corporations used the redemption money for early repayment of all housing loans to the government. As a result rent subsidies decreased sharply in 1995.

Restitution of excise duties on wine

In 1996 because of a finding of the European Court of Justice, the government had to pay back 204,2 million euro to the wine branch. The exempt from excise duties on fruit wines (till 1992) appeared to be applicable to table wines too.

Financing old people's homes

Starting in 1997 the financing of the services of old people's homes is covered by the Exceptional Medical Health Act (AWBZ). Until that year the financing took place through the general means of the government and own contributions of households. Due to this measure the social assistance benefits in kind decreased while the social security contributions and the social security benefits increased with 1,4 billion euro. The increase of the contributions is compensated by a decrease of the wage tax.

The introduction of the PEMBA

In 1998 the PEMBA was introduced. This is a Dutch acronym for Premium differentiation and the market effect on disablement insurance. The underlying idea of the PEMBA operation is to lay down the risks at the employers, because these were supposed to prevent disablement. The PEMBA operation consists of three measures.

Firstly, the scope has been adapted to that part of the disablement, which is covered by social security, to fit better with different kinds of risks. For this reason the Fund for Disabled Civil Servants (FAOP) and the employee's part of the General Disablement Benefits Act (AAW) were merged with the Disablement Insurance Act (WAO). In contrast the benefits to young disabled persons are no longer covered by the social security contributions (AAW), but through the general funds (WAJONG). Young disabled persons are defined as people who are borne with a handicap and so will never be able to earn income.

Secondly, from now on the disablement contributions are fully covered by the employers. The employers in their turn are compensated by a drastically decrease in their transfer surcharge.

Thirdly, part of the employer's contributions have been made variable, i.e. the contributions for the Disablement Insurance Fund (AOK). These are from now on dependent on the number of employees that became disabled. So in case few employees become disabled, the employer pays less. This is a way to stimulate the employer to prevent employees to become disabled.

11. Deflation of national accounts

11.1 Introduction

One of the most important figures of the national accounts is the volume growth of Gross Domestic Product (GDP). But volume changes of many other national accounts variables play an important role in many fields.

This explanation presents an outline of sources and methods which are used in the deflation of national accounts figures.

In the Netherlands, the compilation of industry-by-industry input-output tables in current prices as part of the regular national accounts data goes back to the fifties. From 1980 onwards, input-output tables in constant prices, next to tables in current prices, became standard procedure.

From the 1987 revision onwards supply and use tables, both in current and constant prices, are used as an integration framework. Contrary to input-output tables, supply and use tables make optimal use of available sources since production statistics, foreign trade statistics, data on consumption and capital formation all contain information on *products*.

The introduction of supply and use tables has improved the quality of the estimates. A closer link with source statistics on supply and use and - maybe even more important - with price statistics sums up the main reason for this improvement

11.2 Some issues in constant price estimation

Simultaneous compilation and balancing of current and constant price tables

Up until the early 'eighties, the integration of national accounts data at Statistics Netherlands was performed in current prices with a rough deflating procedure afterwards to establish volume changes. With the final estimate of the year 1981, Statistics Netherlands started experimenting with the simultaneous compilation of input-output tables in both current and constant prices. The first tables (of the industry by industry type) were of a rather limited size (200 x 100), but the method proved nevertheless to be an effective way to estimate good quality current and constant price values, value indices, volume indices and price indices.

One of the main problems in this compilation process was the lack of homogeneity in an industry-by-industry input-output table. By implication, this means that in principle each cell has to be broken down into its main products to calculate correct deflators and thus correct volume measures.
As a result, the second improvement swiftly followed the first: with the revision of 1987, the system developed into a full-fledged set of supply and use tables describing 250 industries by 800 products. This set became the main integration framework with the traditional industry-by-industry input-output tables as an important side product.
A major advantage of compiling price and volume measures within an accounting framework such as the supply and use tables is that a check is provided on the numerical consistency and plausibility of the set of measures as a whole. Another advantage is that price and volume measures for the important balancing items can be derived. In particular, gross value added can be measured at constant prices by subtracting intermediate consumption at constant prices from output at constant prices, the "double deflation" method.

The choice of the index number formulae

Part of the design of the system is the choice of index formulae to be used in the integration framework. From a practical point of view, two requirements should be imposed on the index number formulae to be used in compiling constant price data:

- additive consistency.
- value index = price index x volume index.

In an accounting framework like the supply and use table, additivity simplifies the balancing of the system. All consistency checks, which are valid in current prices, hold also at constant prices. The second requirement means that the value index is completely split up in a volume part and price part.
The international guidelines for national accounts favours Fisher's index, because of its close approximation of the theoretical superlative index formulae like the Tornqvist and Vartia. Disadvantage of the Fisher is that it is demanding in its data requirements, and that its results are not easy to be interpreted and, last but not least, not additive consistent. This means that the Fisher index is not easily applicable in an accounting framework where additivity is an important issue. A way out is the use of a combination of Paasche price indices and Laspeyres volume indices. This combination of indices fulfils the requirements mentioned above.

The choice of the base year

Another issue in constant price estimation is the choice of the base year. Both the SNA 1993 and the ESA 1995 favour the use of a moving base year. In practice, this means that t-1 will be the base year. Advantages are:

- an up-to-date weighting scheme provides better estimates of growth rates.
- no burdensome rebasing of time series.

Applying several types of index number formulae using the detailed supply and use data of the Netherlands, shows that Paasche and Laspeyres chain volume indices in general provide a close approximation of Fisher's Ideal Index.

A disadvantage when using chain indices to construct time series of values in constant prices of a certain base year is that the deflated parts of an aggregate do not add up to the deflated aggregate itself. The magnitude of this "mathematical discrepancy" varies with the way the aggregate is split up in different sub groups.

Non-additivity

In the Dutch National Accounts publication, the mathematical discrepancies in constant price tables are not eliminated, but these tables are left non-additive. In the publication constant price tables are not presented separately, but always in conjunction with other tables and in a fixed sequence: current prices, volume changes, chain volume indices, values at constant prices (by applying these volume indices). Price changes and chain indices of deflators are given as well.

Quality changes

Changes in values resulting from changes of quality should be excluded from the price index and included in the volume index. The volume index = quantity index x quality index. Quality changes can occur in two ways: changes in the product mix and changes in the (physical) characteristics of products.

The requirement of a proper measurement of quality change from changes in the product mix is fulfilled to a higher degree when transactions are more homogeneous. The number of product groups in the Dutch supply and use table (800) is considerable. From this point of view, quality changes are measured reasonably well.

For the measurement of quality changes of individual products, it is necessary that in price statistics changes in the value per unit are corrected for changes in the (physical) characteristics of goods and services. Generally speaking, the Dutch price statistics for production, international trade and private consumption of households, which are the main source for the deflators applied for the

supply and use table at constant prices, provide price indices, which are not considerably biased by quality changes.

In some cases quantity indicators are used for the deflation of output. For instance, agriculture quantity series are often available for rather homogeneous products at a low level of aggregation. For some products, where quality changes appear annually, quantity units are standardised (for instance milk, sugar beets, potatoes).

11.3 Main sources used

In the deflation of the national accounts figures the main sources used are producer price indices and consumer price indices. Examples of other sources are quantity indicators, unit-value indices, price and quantity data from agriculture related agencies and annual reports of enterprises.

Producer price indices

A considerable part of the price index numbers used for the deflation of commodities in the Dutch national accounts is from the statistic roducer price indices.

Consumer price indices

Consumer price index numbers are used for the deflation of private consumption of households. They are also applied as approximate deflators in case of the lack of producer price indices for output or for intermediate consumption.

The published consumer price indices present the average price change of the goods and services bought by the average Dutch private households in the base year. For deflation purposes in the national accounts the consumer price indices are applied at least at the detailed 800 commodity level of the supply and use tables.

Other sources

Other data used in the deflation of the national accounts are: quantity indicators, unit-value indices, price and quantity data from agriculture related agencies and annual reports of enterprises.

For some specific products (services by banks, insurance services, education, passenger transport by train etc.) no proper price indices are available for the deflation of output, but there are (nearly) integral and detailed quantity data. Examples are: number of saving accounts and credits, number of life insurance policies, number of pupils, passenger kilometres etc.

Unit-value indices are used for the deflation for some specific cases where values and quantities are available for transactions of homogeneous products (especially bulk goods). Examples are the exports and imports of certain agricultural products. Another example is the output of certain transport services where for a representative number of the reporting units, next to the value of production, data on tonne kilometres are available.
More often, unit-value indices are used to check the plausibility of other price indicators like the producer price indices of exports and imports.

Especially for specific agricultural products, the value of output is derived from the combination of price and quantity data at a low level of aggregation. The price data are often provided by semi-governmental agencies related to the agricultural sector like the Landbouw Economisch Instituut (Agricultural Economic Institute) and the Productschappen (commodity boards) for horticulture, dairy products, eggs etc.

In some cases price and/or quantity data from annual reports of enterprises are applied for the deflation of output. Examples are telecom services and postal services.

Balancing

Even though the balancing process is not a real “source” of price and quantity indicators, it plays an important part in the quality of the estimates. At first for checks of consistency for instance between producer and consumer price indices. More in general values, prices and volumes are checked during the simultaneous balancing of current price values and constant price values.

11.4 Value added and its components

The Dutch method for the deflation of value added at basic prices of an industry depends of the character of the main output. The output of goods and services can be classified into market output and non-market output. Besides, for deflation purposes it is important to divide non-market output into individual goods and services and collective services.

Value added of industries producing market output

Total value added in current prices by industry is estimated as the difference between gross output and intermediate consumption of goods and services. For the estimates at constant prices the same method is applied. Therefore, total value added in constant prices by industry is estimated as the difference between deflated gross output and deflated intermediate consumption of goods and services.

Value added of industries mainly producing non-market individual goods and services

In the case of industries mainly producing non-market individual goods and services, there is a difference in the way current price estimates of value added and constant price estimates of value added are made.

Output in current prices is estimated as the sum of total intermediate consumption, labour costs, other taxes and subsidies on production and consumption of fixed capital. As a result, value added at current prices equals the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital.

Output in constant prices of an industry mainly producing non-market individual goods and services is estimated by multiplying output in t-1 by the volume index of output.
Deflated total value added in constant prices is estimated as the difference between deflated gross output and deflated intermediate consumption of goods and services.

In the Netherlands for the majority of the production of non-market individual goods and services volume indicators are available. The main example is educational services.
In other cases for deflation purposes the same method is used as for collective services.

Value added of industries mainly producing collective services

In the case of industries, mainly producing collective services there is a resemblance in the way current price estimates of value added and constant price estimates of value added are made.

Output in current prices is estimated as the sum of total intermediate consumption, labour costs, other taxes and subsidies on production and consumption of fixed capital. As a result, value added at current prices equals the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital.

No appropriate quantity indicators are available for the estimate of the volume change of the output of collective services. Therefore, as an approximation, output of an industry producing collective services in constant prices is calculated as the sum of total intermediate consumption, labour costs, other taxes and subsidies on production and consumption of fixed capital in constant prices. As a result, value added at constant prices equals the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital in constant prices.

In the Dutch national accounts the estimate of the consumption of fixed capital in constant prices is an implicit part of the estimate in current prices. Implicit deflators are the price indices of the domestic purchases per commodity, which are derived as the weighted

average of the producer price indices of domestic sales and imports.

Compensation of employees

Compensation of employees is part of total value added. It is useful to estimate compensation of employees in constant prices, as it increases the possibilities for economic analysis based on supply and use tables. Among others, the results can be used in the analysis of labour productivity.

Compensation of employees consists of two parts, wages and salaries, both in cash and in kind, and employers' social contributions.

Wages and salaries

In the calculation of wages and salaries in constant prices a price approach is applied: price changes of labour input are observed and volume changes are derived.

Employers' social contributions

The volume index of employers' social contributions should equal to the volume index of wages and salaries. The price index can then be derived from the value index and the volume index.

Wages and salaries in kind

In the estimation of wages and salaries in kind in constant prices it is assumed that the volume index of wages and salaries in kind equals the volume index of wages and salaries in cash.

Taxes and subsidies on products

Taxes and subsidies on products affect the *price* of a product and not the *volume*. This means that for deflation it is a requirement that the volume index of the value inclusive tax (subsidy) of a product equals the volume index of the value exclusive tax (subsidy). As a result also the volume index of the tax (subsidy) value must equal the volume index of the value inclusive (or exclusive) tax (subsidy).

For an accurate estimation of the volume index of a tax or a subsidy, special attention is given to the question which part of the supply or use of a commodity is taxed or subsidised. For instance, a tax is levied only on the domestic consumption of a product and not on exports.

Other taxes and subsidies on production

In the deflation of other taxes and subsidies on production volume indicators are used in many cases.

11.5 International comparability

International guidelines for national accounting such as the System of National Accounts 1993 (SNA 93) and the European System of Accounts 1995 (ESA 95) contain each one relatively short chapter on price and volume measures.

The Stability and Growth Pact, agreed by the EU member states in 1997, asked for, among other things, higher quality and more comparable data on economic growth. As a result, in 1993 the statistical Bureau of the European Union (Eurostat) published the Handbook on price and volume measures in national accounts. This book provides a complete discussion of the issues involved in measuring prices and volumes, from the general principles to the deflation of individual goods and services. It is fully consistent with the principles of the ESA 1995.

Annexes

1. The economic activities in the extensive supply, use and input-output tables

SBI 1993	Description
	Agriculture, forestry and fishing
01.11	* Arable farming
01.12	* Horticulture
01.2	* Live stock
01.3	* Other agriculture
01.4	* Service activities related to agriculture
02+01.5	* Forestry and hunting
05	* Fishing
	Mining and quarrying
11	* Crude petroleum and natural gas production
10+14	* Other mining and quarrying
15-16	Manufacture of food products, beverages and tobacco
15.1	* Manufacture of meat
15.2	* Manufacture of fish products
15.3	* Manufacture of vegetable and fruitproducts
15.5	* Manufacture of dairy products
15.71	* Manufacture of animal feeds
15 rest	* Manufacture of other food products
15.86	* Manufacture of coffee and tea
15.9	* Manufacture of beverages
16	* Manufacture of tobacco products
	Manufacture of textile and leather products
17	* Manufacture of textiles
18	* Manufacture of wearing apparel
19	* Manufacture of leather and leather products
21	Manufacture of paper and paper products
21.1	* Manufacture of paper
21.2	* Manufacture paper products
22	Publishing and printing
22.1-2	* Publishing and printing
22.3	* Manufacture of recorded media
23	Manufacture of petroleum products; cokes, and nuclear fuel
	Manufacture of basic chemicals and man-made fibres
24.1.3	* Manufacture of inorganic basic chemicals
24 rest	* Manufacture of other basic chemicals and man-made fibres
24.1.4	* Manufacture of petrochemicals
24.1.5	* Manufacture of fertilisers and nitrogen compounds
24.2-6	Manufacture of chemical products
25	Manufacture of rubber and plastic products
27	Manufacture of basic metals
28	Manufacture of fabricated metal products
29	Manufacture of machinery and equipment n.e.c.
29.1-6	* Manufacture of other machinery and equipment
29.7	* Manufacture of domestic appliances

SBI 1993	Description
	Manufacture of electrical and optical equipment
30	* Manufacture of office machinery and computers
31	* Manufacture of electrical machinery n.e.c.
32	* Manufacture of radio, television and communication equipment
33	* Manufacture of medical and optical equipment
	Manufacture of transport equipment
34	* Manufacture of motor vehicles
35.1	* Manufacture of ships and boats
35.2-3	* Manufacture of trains, trams and aircraft
35.4-5	* Manufacture of other transport equipment
	Other manufacturing
20	* Manufacture of wood and wood products
26	* Manufacture of other non-metallic mineral products
36.1	* Manufacture of furniture
36.2-6	* Manufacturing n.e.c.
37	* Recycling
	Electricity, gas and water supply
40.1	* Electricity supply

95	Private households with employed persons
80.4; 91; 93	Other service activities n.e.c.

The data in the chapter Production, use and income generation are aggregated. This annex gives for each economic activity, distinguished in that chapter, the underlying groups for which information, consistent with the macro data, is available within the framework of detailed supply and use tables and input-output tables. The detailed tables are on request available.
The industries marked "*" are details which are not mentioned in the tables in the chapter Production, use and income generation.

2. The product groups in the extensive supply and use tables

Row G 0.1 G 0.2	Description
1	**Products of arable farming and horticulture**
	Cereals
	Potatoes
	Oilseeds
	Tobacco
	Other agricultural products
	Vegetables
	Flowers; plants
	Fruit
	Other crops
*	**Live animals and animal products**
	Bovine cattle
	Raw milk
	Swine
	Other live animals and live animal products
*	**Services related to agriculture**
	Horticultural services
	Agricultural services
2	**Products of forestry**
3	**Products of fishing**
4	**Crude petroleum and natural gas**
	Petroleum oils
	Natural gas
	Surveying
5	**Other mining and quarrying products**
	Coal and lignite
	Uranium ore
	Other ores
	Minerals
6	**Meat and fish products**
	Meat
	Processed and preserved fish (smoked, marinated and/or canned
*	**Potato, vegetable and fruit products**
*	**Oils and fats**
	Cattle cakes
	Margarine and low-fat margarine
	Other products of margarine manufacture
*	**Dairy products**
	Skimmed milk
	Milk
	Whey and whey products; milkpowder
	Butter; colza oil
	Cheese
	Other dairy products
*	**Grain and starch products**
	Rice; grain products
	Starch products
*	**Food products n.e.c.**
	Prepared animal feeds
	Pet food
	Bakery products
	Sugar
	Cacao; chocolate; sugar works
	Coffee and tea
	Other food
*	**Beverages**
	Spirits
	Wines (incl. port, sherry etc.)
	Beer
	Soft drinks
7	**Tobacco products**
8	**Textiles**
	Textile fibres and fabrics
	Other textile wares
9	**Wearing apparel**
10	**Leather and leather products**
11	**Wood and wood products (excl. furniture)**
	Wood
	Wood products
12	**Paper and paper products**
	Paper and paperboard
	Toilet paper and tissues
	Other paper and paperboard stationery
13	**Printed matter and recorded media**
	Books, brochures and the like
	Printing for periodicals
	Subscriptions on periodicals
	Journals and periodicals (advertisements)
	Compact disks, floppies and other recorded media
	Reference books
	Binding services
	Composition and platemaking
	Other printed matter
14	**Petroleum products**
	Coke of coal and the like, coal derivatives
	Motor spirit (excl. aviation spirit)
	Kerosene
	Gas oil and diesel oil
	Other liquid fuels
	Nuclear fuel

Row G 0.1 G 0.2	Description
15	**Chemical products and man-made fibres**
	Basic inorganic chemicals
	Basic organic chemicals
	Fertilisers
	Synthetic resins
	Other basic chemicals
	Pesticides
	Paints and the like
	Basic pharmaceutical products, antisera and vaccines, medicaments
	Soap and the like
	Other chemical products
	Man-made fibres and yarn and thread
16	**Rubber and plastic products**
	Rubber products

The supply and use tables (tables G 0.1 and G 0.2) are highly aggregated. This annex gives for each product group the underlying commodity groups for each of which information is available. The "*" marked product groups are already mentioned in the tables of the chapter Supply, production and final expenditure.

3. Papers and international publications

This annex contains three lists. They present a number of papers discussing fundamental theoretical or statistical issues related to national accounting, or on analyses based on national accounts figures.
The occasional papers (list A) are written in English. They are especially aimed at experts on national accounts. The occasional papers cost € 9,08 each.
Methods and research (list B) is a series written in Dutch, which aims at a broad group of users of the National accounts. A paper in this series costs € 5,67.

List C contains a number of important publications by international organizations with comparable figures for other countries. This list also contains the international guidelines in the field of national accounts and some international magazines. Besides that, the CBS libraries have a large number of publications at their disposal with detailed information on national accounts of other countries.
See the colophon for information on how and where to order.

A. Occasional papers

NA/01 Eck, R. van, Gorter, C.N. and Tuinen, H.K. van, 1983,
Flexibility in the system of National Accounts.

NA/02 Broesterhuizen, G.A.A.M., 1983,
The unobserved economy and the National Accounts in the Netherlands, a sensitivity analysis.

NA/03 Eck, R. van, 1985,
Secondary activities and the National Accounts: Aspects of the Dutch measurement practice and its effects on the unofficial economy.

NA/04 Al, P.G. and Broesterhuizen, G.A.A.M., 1985,
Comparability of input-output tables in time.

NA/05 Al, P.G., Balk, B.M., Boer S. de and Bakker, G.P. den, 1985,
The use of chain indices for deflating the National Accounts.

NA/06 Bochove, C.A. van and Tuinen, H.K. van, 1985,
Revision of the system of National Accounts: the case for flexibility.

NA/07 Bos, C. van den, 1985,
Integration of input-output tables and sector accounts; a possible solution.

NA/08 Bochove, C.A. van, 1985,
A note on Dutch National Accounting data 1900-1984.

NA/09 Bochove, C.A. van and Bloem, A.M., 1985,
The structure of the next SNA: review of the basic options.

NA/10 Al, P.G., 1985,
Dual sectoring in National Accounts.

NA/11 Harthoorn, R., 1985,
Backward and forward linkages with an application to the Dutch agro-industrial complex.

NA/12 Harthoorn, R., 1986,
Production chains.

NA/13 Boer, S. de and Broesterhuizen, G.A.A.M., 1986,
The simultaneous compilation of current price and deflated input-output tables.

NA/14 Al, P.G. and Bochove, C.A. van, 1986,
A proposal for the synoptic structure of the next SNA.

NA/15 Eck, R. van and Kazemier, B., 1986,
Features of the hidden economy in the Netherlands.

NA/16 Bochove, C.A. van, 1987,
Uncovering hidden income distributions: the Dutch approach.

NA/17 Bochove, C.A. van and Huitker, T.A., 1987,
Main national accounting series 1900-1986.

NA/18 Bakker, G.P. den, Huitker, T.A. and Bochove, C.A. van, 1987,
The Dutch economy, 1921-1939 and 1969-1985. A comparison based on revised macro-economic data for the interwar period.

NA/19 Bochove, C.A. van and Sorge, W. van, 1987,
Constant wealth national income: accounting for war damage with an application to the Netherlands, 1940-1945.

NA/20 Bochove, C.A. van, 1987,
The micro-meso-macro linkage for business in an SNA-compatible system of economic statistics.

NA/21 Bloem, A.M., 1987,
Micro-macro link for government.

NA/22 Harthoorn, R., 1987,
Some extensions of the static open Leontief model.

NA/23 Laan, P. van der, 1987,
Compilation of household sector accounts in the Netherlands National Accounts.

NA/24 Harthoorn, R. and Dalen, J. van, 1987,
On the adjustment of tables with Lagrange multipliers.

NA/25 Janssen, R.J.A. and Algera, S.B., 1988,
The methodology of the Dutch system of quarterly accounts.

NA/26 Gorter, C.N., 1988,
Imputations and re-routeings in the National Accounts.

NA/27 Bos, F., 1988,
Registration of trade in services and market valuation of imports and exports in the National Accounts.

NA/28 Bos, C. van den, 1988,
The institutional sector classification.

Subject	Kind of data	Period
Social Accounting Matrix, integrated data framework based on national accounts extended with information on income, consumption and savings by household category	cup	1990-2000
Social security benefits by function and law	cup	1995-2002
Exports of goods and services separately, by industry in producers' prices and trade and transport margins	cup	1995-2002

Those statistics with an (*) are not intended for publication without express consent of Statistics Netherlands.

Abbreviations:

cup = current prices
cop = constant prices
pi = deflators (indices)
vi = volume indices
vc = volume changes

5. International data

5.1 Introduction

National accounts data are published on paper in the publications 'Nationale rekeningen' in Dutch and 'National accounts of the Netherlands' in English and on the CBS-site (StatLine) on internet (http://www.cbs.nl).

National accounts data are used by a large number of institutions, for instance Eurostat (the statistical bureau of the European Union), OECD, UN, IMF, ECB (the European Central Bank) and ILO (International labour office).

The Netherlands are, due to international rules, obliged to furnish to international institutions clearly defined data at a certain point of time. The most important recipient is Eurostat; this institute redirects the data to the OECD, UN and the ECB. Eurostat also calculates the aggregates for the EU and the EMU (the Economic and Monetary Union). Here the itemised accounts can go further than the 'regular' publication scheme of the Dutch National accounts.

5.2 Eurostat

The rules of the EU commit the Netherlands to provide Eurostat with its National accounts data. This is a matter of legal obligation.

Council Regulation (EU) Nr. 2223/96, dated 25 June 1996 concerning the European System of National and Regional Accounts (ESA 1995) in the EU describes in detail which and when data must be provided to Eurostat. The regulation has been published in Nr. L310/1, 30 November 1996.

In future the statistical obligations to Eurostat will be extended, e.g. in 2005 comprehensive accounts of government, including financial accounts must be available.

5.3 Administrative use of national accounts data

A large number of international treaties and international guidelines contain data from the national accounts. The international significance and the administrative application of national accounts data are on the increase all the time.

Both the VAT-contribution as well as the GDP-contribution of the Netherlands to the EU is based on the National accounts. On the revenue side the national accounts dominates the picture. The distribution of the GDP over the regios, which can be traced from the regional national accounts, partly determines the level of the contribution, which the Netherlands will receive from the European structural funds. In short, the net position of the Netherlands in relation tot the EU will to a large extent be determined by national accounts data.

Because of the increasing importance of the GDP it has become that all European members exactly apply the same definitions for the statistical concepts. So that's why agreements have been made for mutually comparable harmonised figures.

Under the auspices of Eurostat a GDP manageable committee has been founded, which as its main task to guard the quality of the GDP estimates of the member states. The committee checks whether the regulations are observed. Checks are also made by the European Auditor's Office. The quality and international comparability of the national accounts had a favourable effect.

The government debt and the government deficit as a percentage of the GDP play an essential role for the entry to the EMU (Maastricht Treaty) and in the stability pact (Amsterdam Treaty). A fine due to the failure to comply with the obligations of the Treaty of Amsterdam and possible mitigating circumstances (economic depression) are related to the national accounts.

5.4 International classifications

The concepts and classifications of the national accounts have been worldwide standardised and are laid down in international guidelines (SNA 1993 and ESA 1995). This is of vital importance for international comparability.

In general the Dutch national accounts follow the international classification of ESA 1995. In a limited number of cases the classification has been adapted to the Dutch situation.

In the ESA 1995 the following classifications are distinguished:
Industries (NACE Rev.1).
Products (CPA).
Institutional sectors.
Transactions and accounts.
Individual consumption by purpose and functions of Government.
Statistics Netherlands has its own classification, the Standard Classification of all (Dutch) Industrial Activities 1993 (SBI 1993). This classification is based on the European Nomenclature Générale des Activités Economique dans les Communautés Europeeanes (NACE). The SBI 1993 is on 4-digit level similar to the NACE. In the lower 5-digit level it contains specific additions, especially adapted to the Dutch situation.

The classifications of industrial activities in the chapter Output, consumption and generation of income deviates at several points from the one used in the ESA 1995. The relation between the Dutch National accounts and the ESA 1995 (A60) is shown in table 1. The ESA 1995 classifications A3, A6, A17 and A30 are actually aggregates of the A60-classification.

Table 1. Relation between the industry classification of the Dutch National accounts and the ESA 1995

National accounts, Chapter Output, consumption and generation of income	ESA 1995, A60	Code NACE Rev. 1
Agriculture, forestry and fishing	Agriculture, hunting and related service activities	01
	Forestry, logging and related service activities	02
	Fishing, operation of fish hatcheries and fish farms; service activities incidental to fishing	05
Mining and quarrying	Mining of coal and lignite; extraction of peat	10

Statistical supplements (time series 1969-2002)

Introduction

The revision 1995 has now been calculated backwards until the year 1969. That means that consistent time series are available for a period of 33 years. The full set of time series of national accounts data for the years 1969-2002 is presented in StatLine, the electronic database of Statistics Netherlands (www.cbs.nl). These statistical supplements show a selection from the time series.

Revisions

The National accounts are periodically under revision. The latest revision concerned the year 1995. Since then the Dutch national accounts are harmonised with the international guidelines: the European System of Accounts 1995 (ESA 1995) and the System of National Accounts 1993 (SNA 1993). In addition new statistical views and results have been incorporated in the national accounts and new sources or other estimation methods have been applied. Besides a full fit between national accounts and labour accounts has been made. That means that full consistency consists between national accounts and labour market data.

The results of the 1995 revision are presented in the publication National accounts 1998 with figures for the years 1995-98. A description of the 1995 revision is given in the publication Revision Dutch National accounts: first results and backgrounds.

The 1995 revision has not only carried through in the Netherlands but in the other member states of the European Union (EU) as well. Therefore, the international comparability of national accounts data has been strongly improved.

Time series

Data in the national accounts are estimated in such a way that they are comparable with data for contiguous years, thus reflecting year to year changes as accurately as possible.

Only at periodic revisions levels are updated and newly computed. Data for previous years are also adjusted in order to retain comparability in time.

From the 1977 revision onwards revisions are calculated backwards to the year 1969. This is also the case for the 1995 revision. In the publication National accounts of the Netherlands 2001 revised figures until 1987 are presented. Now the revision 1995 has been calculated backwards until 1969.

In calculating backwards a revision it is not always possible to reach the same level of detail as one could for more recent years. This is due to a lack of sufficient statistical information.

In the compilation of the time series supply and use tables have been made until the year 1987. The input-output tables and the labour market data have been calculated backwards until the year 1969. However, the labour market data are less detailed for the years before 1987 then after 1987. The sector accounts start in 1980, however for the sector government figures are available from 1969 onwards. Financial balance sheets are available from 1990 onwards. For many variables in the chapter (sub)sectors typically detail data time series from 1969 onwards have been made.

In other member states of the EU time series have been made. At this point too international comparability has been reached.

A description of some breaks in the long time series is given in explanation 10 in this publication.

Some other CBS-publications

Nationale rekeningen 2002 (Dutch edition of the 'National accounts of the Netherlands 2002')

This publication gives a complete survey of the development of the Dutch economy and contains detailed data on product groups, industrial activities and sectors for the years 1995-2002. The publication has been divided in several chapters and closes with explanations and annexes. As annex a selection of national totals has been added for the period 1969-2002.
Annual, 314 pp., € 42.55.
ISBN 903572708 8. Key figure P-2.

The Business Cycle in the Netherlands

With the in 2000 started publication "The Business Cycle in the Netherlands" a detailed, consistent survey is given of recent developments of the Dutch economy, based on many data on the business cycle of Statistic Netherlands. The connection is reached by - among other things - using the results of the Quarterly Accounts, which show a systematic description of the economy.
Quarterly, 75 pp., € 34.85, per annum.
ISSN 1566-3191. Key figure P-104.

The Dutch Economy 2002 (Dutch edition)

Through this publication Statistic Netherlands aims to sketch an actual, broad and consistent survey of recent socioeconomic developments in the Netherlands. The results of the publication "National accounts 2002" have been incorporated. Items like macroeconomic surveys, labour, population, welfare, regional and modules of the national accounts can be found there. Also attention is paid to a comparison between the Netherlands and other EU-countries, the USA and Japan.
Annual, about 336 pp., € 14.25
ISSN 1386-1042. Key figure P-19.

Statistical Bulletin (Dutch edition)

The Statistical Bulletin is published weekly with the most recent results of all statistical researches by Statistics Netherlands. A subscription contains the monthly Business Cycle report. Here the actual state of affairs of the Dutch economy is shown in short and snappy analyses through graphic presentations.
Weekly, about 10 pp., € 72.25 per annum.
ISSN 0166-9680

Statistical yearbook of the Netherlands 2003

This publication provides you with actual figures on nearly all aspects of the Dutch society. We find there items like man and society, labour, income and social security, business, government, politics, macroeconomics, money and capital market and geography and environment.
Annual, 560 pp., € 25.00, incl. StatLine cd-rom.
ISSN 0924-2686. Key figure A-26.

Internet

The Statistics Netherlands-website can be accessed through www.cbs.nl. The site contains statistical key figures and publications on the Dutch society. Recent statistical results can be found in press releases and bulletins, which can be downloaded.

StatLine

StatLine is the free electronic databank of Statistics Netherlands. StatLine provides statistical information in the shape of tables texts and graphs. All results can be studied, printed or exported. StatLine provides you also with time series on a variety of social and economic items. StatLine can be found on the website www.cbs.nl (see also the chapter "Figures in StatLine" in the publication National accounts of the Netherlands 2002).

Unless otherwise stated all publications by Statistics Netherlands can be obtained from the sales department of Statistic Netherlands, Heerlen, e-mail verkoop@cbs.nl or by bookshop.
All publications are open for inspection or can be obtained on loan at the libraries of our Bureau at both branches. Also in both branches are bookshops, where publications can be obtained in cash.
