

***National accounts
of the Netherlands
2005***

Foreword

The recovery of the Dutch economy, which started in 2004, continued in 2005. However, taking inflation into account, household incomes declined for the fourth successive year. Households spent more than they earned and had to draw on their savings accounts. Corporate profits, on the other hand, increased and the budget deficit was practically reduced to zero. The financial position of pension funds improved considerably due to profits made on the stock exchange. This and more appears from this National accounts of the Netherlands 2005.

National income, volume growth of gross domestic product (GDP) and the government deficit or surplus are important National accounts figures. In addition to these indicators, National accounts also show data on employment, the contribution of individual industries to GDP, developments in final consumption and fixed capital formation.

The National accounts also include detailed supply and use tables, input-output tables, sector accounts, data from the Social Accounting Matrix, environmental accounts and many detailed tables on specific transactions like taxes and social contributions. For the main macroeconomic aggregates long time series are presented, some of them starting from 1900. This publication contains annual data at a national level. Quarterly and regional data are published separately.

The 2001 revision of the National accounts has now been calculated backwards until the reporting year 1995. In spring 2007 revised figures for the period 1969-1994 become available.

The National accounts represent the official statistical review of the national economy. They provide the standard framework for preparing, discussing and evaluating economic and monetary policy. Economic forecasts and analyses of alternative policy scenarios by the Netherlands Bureau for Economic Policy Analysis are based on the National accounts.

The publication 'De Nederlandse economie 2005' is published in addition to the National accounts of the Netherlands 2005. It signals major developments in the Dutch economy. This year extra attention is paid to the growing internationalisation of the world economy. This publication is available in Dutch only.

Figures in StatLine

StatLine

The data of the National accounts are also available through internet. Via this medium you can get access to StatLine, the electronic databank of Statistics Netherlands. StatLine contains statistical information on many economic subjects. The figures are available as a so-called matrix publication, i.e. the desired data can be asked for through a search or selection menu (Web-selector). The results may be consulted, printed and downloaded in the form of tables and graphs free of charge. In addition it is possible to search with key words.

How to find national accounts data in StatLine

In StatLine you will find many data on national accounts. In order to find an item very quickly you go to the opening paragraph of the homepage of Statistics Netherlands, 'www.cbs.nl'. By moving the cursor to the right selecting the button "Shortcuts" you choose the displayed menu to 'StatLine'. In the new screen you will find an explanation on how to obtain or select information. On the now displayed screen you will find on how you can get information or how to select.

By selecting a button on top of the page 'StatLine' you get a display which enables you to approach StatLine in two ways, namely 'Select' and 'Search' (see figure 1).

By entering an entry and then selecting 'search' the search-machine of Statistics Netherlands will select a large number of tables from the StatLine databank, which displays your chosen entries.

You can also independently search in the item-tree of StatLine. This is possible by clicking on Select (see figure 1). The StatLine Webselector (see figure 2) will be started. By clicking on a '+' or by twice clicking on a yellow icon the underlying themes or publications are shown. The publications are shown by a blue arrow. As a next step you can make a choice from year quarter and from regional data from a number of economic items. So you can compose that selection and the tables by choosing items, classification, type of figures and periods.

In figure 2 the matrix publications are shown of the national accounts annual figures. Figure 2 also shows an example of the matrix publication 'Output, consumption, income'. In the right part of the screen items are shown as type of figures and years. By clicking '+' you can make your choice from submaps or subitems. To select several data you must press down the CTRL-button while you select.

After your selections you can select 'Show data'. Within the selected table you still can make adaptations by mutually shifting the columns topics, type of figures and years. As a next step you can print or store the table.

A selected table can be send by e-mail to interested people. Click the button 'Link store as' and copy one of the URLs and import them in your E-mail with the aid of menu-choice 'Insert' and then choose 'Hyperlink'.

What national accounts data you can find in StatLine

You can find 2 matrix publications with annual data on national accounts. You find them in the main group 'Economy, prices and government finance'. Then you click twice the yellow icon of the subgroup 'National accounts' and by clicking the '+' of Annual National accounts the matrix publication is shown (see figure 2). The matrix publications correspond with the series in the publications National accounts of the Netherlands 2004. The relations between the StatLine matrix publications and the chapters in the publication National accounts are:

StatLine matrix publications	National accounts chapters in the publication
Macroeconomic data	Macroeconomics
Goods and services	Supply, use and final expenditure
Final consumption	Idem
Groups of products	Idem
Imports and exports	Idem
Fixed capital formation	Idem
Production process	Output, consumption and generation of income
Labour accounts	Labour
Sector accounts:	Sector accounts:
Sector data	Sector data
Financial balance sheets	Financial balance sheets
Detail data	(Sub)sector typically detail data
Special purpose entities	data
History National accounts	Historical data

At the moment two data matrices are available in English: Macroeconomic data and Production process. The other ones will follow in the future.

Data covering longer periods can be found in the matrix publication 'Historic national accounts'. The topics GDP, wages and salaries, employers social contributions, consumption of fixed capital, imports, exports, consumption expenditures, capital formation and labour return in detail in the other matrix publications.

Quarterly national accounts data and regional figures can also be found at the subgroup 'National accounts'.

Main changes in the publication

General changes

In 2005 the national accounts for 2001 have been revised. The revision has now been calculated backwards until 1995. The revision is described extensively in the publication 'Nationale rekeningen 2004, Revisie 2001 – Beschrijving en uitkomsten revisiejaar 2001' (Dutch edition).

This publication presents figures for the years 1995 and 2000 up to and including 2005. The complete time series are available in StatLine, the electronic database of Statistics Netherlands: www.cbs.nl.

Revised figures back to 1969 become available in spring 2007. Time series which have not yet been revised for the period 1969-1994 are obtainable by the hyperlink: <http://www.cbs.nl/en/publications/articles/macro-economics/national-accounts/time-series-na-rev2001.htm>.

The base year for the index numbers has been changed from 2001 into 2000. The figures at constant prices are at prices of 2000.

Changes in the chapter Key figures: Environmental indicators

The time series 1995-2000 for air emissions have been revised based on changes in the source material. The production of solid waste has been revised based on new data sources and new information.

Changes in the chapter Macroeconomics

In the tables with index numbers and figures at constant prices the base year has been changed from 2001 into 2000.

Changes in the chapter Supply, use and final expenditure

The classification of goods and services in table G 13 Final consumption expenditure by type of goods and services is now the same as in the tables G 14 up to and including G 16.

New are the tables G 25 Stock of fixed assets (net) by type of capital good and sectors and G 26 Changes in stock of fixed assets (net) by type of capital good.

Table G 25 has been renumbered into G 27.

In the tables with index numbers and figures at constant prices the base year has been changed from 2001 into 2000.

Changes in the chapter Output, consumption and generation of income

In the tables P 17 and P 18 the base year has been changed from 2001 into 2000.

Changes in the chapter Labour

New are the tables A 1.2.1 Number of employed persons by sex, A 2.2.1 Jobs by sex, A 2.3.1 Jobs of employees by type of employment and by sex and A 3.2.1 Labour input of employed persons by sex, in full-time equivalent jobs.

The figures about the population aged 15-64 in table A 0.1 Key figures of labour are consistent with the population statistics. For 2001, 2002 and 2003 the population forecast was used. It con-

cerns the population excluding persons in homes and institutions.

Changes in the chapter (Sub)sector typically detail data

Table D 2.4.1 Transactions of the special purpose entities (renumbered into D 2.3.1) has a new content: Other financial institutions excluding special purpose entities. Table 3.3 has been removed. The part "Total expenditure by object" in this table has been moved to table D 3.2 Revenue and expenditure of general government (consolidated). The division of total expenditure in final consumption expenditure and other expenditure has been lapsed.

The tables D 2.3.1 up to and including D 2.3.6 have been renumbered into D 2.2.1 up to and including D 2.2.6. The tables D 3.4 and D 3.5 have been renumbered into D 3.3 and D 3.4 respectively.

Changes in the chapter Historical data

The revision which was carried out in 2005 has now been calculated backwards until 1995. As a result the break in the series in 2001 no longer exists. For the year 1995 data before and after revision are presented.

Changes in the chapter NAM, SAM, NAMEA (now SAM- and Environmental Accounts)

The NAM, SAM, NAMEA and the tables with origin and destination of substance flows are no longer part of this publication. For these chapters SAM-accounts and Environmental accounts have been included.

In the SAM-accounts the tables S 1 Generation of income by sex and level of education and S 2 Resources and uses by type of households have been added. The former tables S 2 Final consumption expenditure of households by type of goods and services and S 3 Social benefits and other current transfers have been renumbered into S 3 and S 4 respectively.

In the chapter Environmental accounts four new tables are presented: NE 1 Integrated physical Environmental accounts, NE 2 Integrated monetary Environmental accounts, NE 3 Physical and monetary supply table, energy and water and NE 4 Physical and monetary use table, energy and water. In these tables the classification by industry is the same as in the other chapters in the publication. The Environmental accounts end with time series in table NE 5 Air emission in the Netherlands of some pollutants, formerly this was table NE 3 (see also the remark under "Changes in the chapter Key figures: Environmental indicators").

Changes in the Explanations

Because the NAM, SAM and NAMEA are no longer included in the publication the former Explanation 6 NAM has been removed. The former Explanation 7 SAM has been replaced by Explanation 6 SAM-accounts. Explanation 8 NAMEA has been replaced by Explanation 7 Environmental accounts. The former explanations 9 up to and including 11 have been renumbered into 8 up to and including 10.

In Explanation 10 Price and volume changes attention is paid to recent improvements in the method for determining price and volume changes in the national accounts. Future improvements are mentioned as well.

Output

TABLE P 1
Output (basic prices) by industry and sector

	1995	2000	2001	2002	2003	2004*	2005*
	<i>mln euro</i>						
INDUSTRIES							
Agriculture, forestry and fishing	20 714	22 560	23 456	23 200	23 242	23 165	23 759
Mining and quarrying	9 715	12 184	14 646	13 491	13 851	15 114	17 844
Manufacturing	162 276	215 136	216 545	211 392	211 057	221 870	234 426
Manufacture of food products, beverages and tobacco	40 130	45 101	46 918	46 552	46 848	47 524	48 107
Manufacture of textile and leather products	4 174	4 473	4 322	4 196	4 045	3 934	3 910
Manufacture of paper and paper products	4 594	5 529	5 550	5 505	5 446	5 508	5 519
Publishing and printing	10 513	13 188	13 453	13 165	12 720	12 591	12 682
Manufacture of petroleum products	8 336	17 742	16 624	15 108	15 617	19 116	25 770
Manufacture of basic chemicals and man-made fibres	16 953	23 744	23 728	23 434	24 258	26 793	29 939
Manufacture of chemical products	8 592	11 200	11 828	12 573	12 436	12 402	12 603
Manufacture of rubber and plastic products	4 559	5 706	5 823	5 984	6 019	6 248	6 545
Manufacture of basic metals	5 187	6 289	5 878	5 671	5 782	7 008	7 790
Manufacture of fabricated metal products	10 753	14 147	14 296	14 022	13 706	14 195	14 705
Manufacture of machinery and equipment n.e.c.	10 472	15 823	16 191	16 167	15 867	17 324	18 216
Manufacture of electrical and optical equipment	15 113	21 385	20 568	18 241	18 108	18 278	17 821
Manufacture of transport equipment	10 078	13 876	14 038	13 759	13 559	14 277	13 572
Other manufacturing	12 822	16 933	17 328	17 015	16 646	16 672	17 247
Electricity, gas and water supply	17 227	20 826	22 964	23 889	25 319	24 934	27 111
Construction	42 579	60 287	64 656	64 880	63 650	64 983	67 686
Construction of buildings	21 810	29 271	30 902	30 715	30 461	31 512	33 010
Civil engineering	7 955	12 133	13 422	13 365	12 669	12 803	13 136
Building installation and completion	12 814	18 883	20 332	20 800	20 520	20 668	21 540
Trade, hotels, restaurants and repair	71 362	105 748	111 382	116 655	113 723	115 058	117 695
Trade and repair of motor vehicles/cycles	8 879	13 726	14 604	15 236	14 561	14 628	14 655
Wholesale trade (excl. motor vehicles/cycles)	33 164	51 551	54 022	57 163	55 706	58 221	61 318
Retail trade and repair (excl. motor vehicles/cycles)	18 655	25 173	26 662	27 734	27 446	26 361	25 489
Hotels and restaurants	10 664	15 298	16 094	16 522	16 010	15 848	16 233
Transport, storage and communication	37 460	59 241	63 335	65 655	66 712	68 283	70 550
Land transport	11 318	15 800	16 474	16 721	16 920	17 481	18 342

1) For the years 1999-2002, income tax is negative. Since 1999 all reductions in wage tax due to deductibility of specific expenses are paid out directly by the tax administration as a provisional reduction in income tax.

2) Capital taxes are non-periodic current taxes on wealth. They are shown as capital transfers paid by households to general government.

1) For the years 1999-2002, income tax is negative. Since 1999 all reductions in wage tax due to deductibility of specific expenses are paid out directly by the tax administration as a provisional reduction in income tax.

2) Concerns the dividend tax from and to the rest of the world.

Explanations

1. National accounts in outlines

1.1 Introduction

The system of national accounts shows a quantitative inventory of the economic process of a country and its economic relations with the rest of the world. As part of the economic process we distinguished between production, generation of income, distribution of incomes, expenditure and financing.

1.2 Economic indicators

The core in the national accounts is a number of important economic indicators such as the gross domestic product (GDP) and the national income. The GDP is a measure for the production in a country of goods and services. Roughly spoken it comes down to the difference of the value of the production and the used goods and services.

The domestic product can be determined gross or net, that is including or excluding consumption of fixed capital. This holds for the net national income as well. The national income is the sum of the primary incomes (wages, profits, on balance received interest and dividend) of the residents of a country. This equals the net domestic product plus net primary income received from the rest of the world.

1.3 Economic processes

In several countries the national accounts are only related to an estimate for one or more of these macrovariables. In that case there is no question of a description of an economic process in the above-mentioned sense. Before the Second World War this was also the case for the Netherlands; the fundamentals for an integrated system were not yet founded. In an extended system of national accounts, as currently used in the Netherlands the description goes far beyond. To start with, an extended preview is given of the production of goods and services and with that to the extent in which is provided in important vital necessities such as food, housing, durables etc. Also a description is given to what extent capital goods are written off and to what extent these through investments are enlarged. Furthermore we pay attention to the way incomes are distributed and we illustrate the redistribution of taxes and social benefits. Finally the national accounts give a description of the financial transactions. All this occurs not only for the total of the economy but also for parts of it. For example the description of the production is detailed in industries. For the description of the income distribution, expenditure and financing sectors are distinguished such as general government, households, non-financial and financial corporations.

1.4 Consistency of the description

The national accounts are called a system which is justified because they form a connected and integrated entity in which all variables are linked together in a consistent way. This contributed largely to the quality and possibilities of the use. The quality is improved because a comparison of the definitions which underlie the system makes it possible to relate the different statistics. Even when the results of these statistics do not agree, it is still possible, through integration, to come to the most plausible estimates. The use of the national accounts is improved because the systematic approach makes it possible to connect a variety of phenomena.

This systematic approach has also its limitations, especially when enforcing changes in concepts and definitions. Partial changes are without question excluded. For instance a change in production is only possible when at the same time concepts such as income, consumption, savings and investment are adapted.

In the system of national accounts estimates have to be made for a great number of variables, variables which are important in itself such as production, consumption, imports and exports, savings etc. For all these variables choices have to be made.

1.5 Uses of the national accounts

For every choice in this field a number of elements play a role. For example the consistency of the system is an important factor. Another important factor is the uses of the national accounts. The uses are rather diverse. To start with: the GDP and the national income are often used as summary standards for the functioning of the economy of a country, the success of pursuing of a financial-economic policy and the financial capacity of the society. For instance net lending / net borrowing of the general government is expressed as a percentage of GDP (EMU-norm). The GNI is one of the foundations of the contribution to the European Union. The national income is used as a guideline for the amount of the development aid and is the basis for all kind of key figures for the government. From the national accounts it is also possible to conclude the relative importance of an industry for the economy through her share in the domestic product.

Furthermore the data of the national accounts are quite often used for prognoses and analysis. Because the data give an integrated and coordinated description of the national economy they are pre-eminently suited for the use in models, which predict the economic development and tests the influence of policy variables. Finally the data are used in the field of the production structure. The data form a specific data base (supply and use tables and input-output tables (see explanation 3) which also serve as a basis for a very multiform application (for example for studies on energy, environment pollution and the consequences of tax policies on production and employment).

1.6 Comments on the uses

The diversity of the uses makes that the choice not always turns out to be an optimum for each use. For instance this goes for the choice between a description of the angle of incidence of the economic actors versus an account of economic processes which is as correct as possible. The first is called an institutional approach, the second a functional one. For an institutional description the producers form the core. They are classified on the basis of the main point of their economic activity into industries. For example producers who have as their main activity transport are classified in the industry transport, storage and communication. This leads to good information about the total production value of the producers which are classified into a certain industry and which join a reality in which the producer operates. However this approach at the same time means that the production because of possible side activities is part of the production value in the industry. Another example is the transport entrepreneur with retail as a sideline.

For the estimation of the total production value of a certain activity (for instance transport) the institutional approach is less suitable, the more when this side activity is practiced by producers in other industries. Here a functional approach offers more advantages. In the Dutch national accounts the institutional approach has been chosen for a number of reasons.

In this framework every choice has been directed at the aim of making the national accounts suitable for as many uses as possible. For specific intentions separate modules should be made which will contain additional data in addition to the standard national accounts and which are needed for a specific point of view or a specific use.

1.7 Perceptions of classifications

For the choice of an as general as possible usefulness another consideration might prevail. A number of concepts which appear in the national accounts (for instance "income") also are used in bookkeeping or in fiscal terms. The meaning of these concepts is not always the same as in the national accounts. However tax figures and data from business administrations are important sources to compose national accounts. A substantial deviation of the concepts in these sources might cause a problem, both the composition of the national accounts and the use of it. More generally it applies that for a good understanding of the national accounts it is important to join as much as possible to the perceptions of the participants in the economic process.

1.8 International comparability

International comparability has already been mentioned as element in the use of the national accounts. A particular country or a national statistical office can not act independently; concepts and definitions are determined in an international context. International guidelines are provided by the United Nations, the European Union and other international organisations. In principle these guidelines are followed in the Dutch national accounts.

1.9 Prosperity

Due to the frequent and versatile use of the national accounts figures it is important that the exact meaning of these data is clear for everybody. The data about production or income, which represent the amount of available goods and services, are but one indicator for the prosperity. Prosperity or use can be defined as the satisfaction of needs of individual citizens. However, prosperity is not measurable and so is not suitable as a unit to express national accounts data. The money-units used in the national accounts are only incompletely related to the use-units, for instance because of the existence of consumer surpluses. Besides, according to many people prosperity of a society can only be expressed in terms of

individual prosperity. For sure adding here is not permitted, since it is impossible to compare prosperity between individual persons. A figure such as national income cannot be a measure for collective prosperity.

1.10 Environment

In the regular part of the national accounts the environmental aspects of production and consumption are only limited taken into account. Only as far as enterprises make actual expenditure to combat pollution, these are included in the national accounts as expenses. However if the government takes care of water treatment this is seen as production by government and this contributes to the national income. This applies too in case the consumer pays. The pollution does not express itself in terms of money. However it is true that in case through the market or a democratic process a price tag is placed on environmental pollution this is taken into account in the national accounts.

The unrestricted extension of the standard description in the national accounts with environmental side effects has clearly its drawbacks. One of them is that environmental side effects should be expressed in terms of money. The information for this is by no mean satisfactory. As a consequence the accuracy of core variables like the GDP and the national income will be affected and the present uses of the national accounts are limited. It should also be noted that economic actors spending decisions are not based on an income that they should have in case an environmental damage was discounted, but on the actual income received in euros.

Still it makes sense to quantify environmental effects in statistical observable units in a separate module in connection with the national accounts (and macro-economic variables such as national income). Also for instance environmental taxes or environmental cleansing services can be differentiated in an environmental module. See also explanation 7.

2. Transactions in the national accounts

2.1 Introduction

The system of national accounts describes transactions by industry and sector on the basis of international guidelines. The transactions by industry are systematically described in the supply and use tables. They focus on transactions in goods and services and on describing the production process, including income generation. The transactions by sector are systematically described in the sector accounts, which focus more specifically on income (re) distribution, use of income and financing. In this chapter, the transactions in the national accounts are further explained.

2.2 Output and generation of income (chapter Output, consumption and generation of income)

Output (basic prices)

Output covers the value of all goods produced for sale, including unsold goods, and all receipts for services rendered. Output furthermore covers the market equivalent of goods and services produced for own use, such as own account capital formation, services of owner-occupied dwellings and agricultural products produced by farmers for own consumption. The output of such goods is estimated by valuing the quantities produced against the price that the producer would have received if these goods had been sold.

Output is valued at basic prices, defined as the price received by the producer excluding trade and transport margins and the balance of taxes and subsidies on products. This is the price the producer is ultimately left with.

Some special cases:

Trade is the distribution of goods in time and space without any physical transformation. So, trade services are produced on behalf of goods. The value of these services is the difference between the sales value and the purchase value of traded goods.

Real estate activities not only include services of non-residential buildings and rented dwellings, but also of owner-occupied dwellings. The latter are valued on the basis of rents of comparable rented dwellings.

Banking mainly deals with financial intermediation, i.e. the acquisition, transformation and issuing of financial assets. The compensation for these services is implicitly included in the interest paid to and received from banks. The value of these imputed bank services is calculated as the margin on attracted deposits and put out loans.

Insurance and pension funding mainly transforms individual risk into collective risk. The value of these services is set as the difference between contributions and benefits. In the case of pension funds and life insurance companies, corrections are made for changes in actuarial reserves.

Government mainly produces collective services. Since there are no market prices available, government output is determined from production costs and is estimated as the total of intermediate consumption, compensation of employees, consumption of fixed capital and taxes on production paid by the government itself.

Intermediate consumption (purchasers' prices)

Intermediate consumption includes all goods and services used up in the production process in the accounting period, regardless the date of purchase. This includes for example fuel, raw materials, semi manufactured goods, communication services, cleansing services and audits by accountants.

Intermediate consumption is valued at purchasers' prices, excluding deductible VAT. For companies, which do not need to charge VAT on their sales, the VAT paid on their purchases is non-deductible. It is therefore recorded as a component of intermediate consumption.

Not included in intermediate consumption are:

- purchases of goods by trade enterprises, which are resold without undergoing any processing.
- purchases of goods used in the production process with a life span of more than one year. These purchases are recorded as fixed capital formation. The use of these goods is spread over their economic life span and recorded as consumption of fixed capital.

Value added (basic prices)

Value added at basic prices by industry is equal to the difference between output (basic prices) and intermediate consumption (purchasers' prices).

Value added (market prices)

Value added at market prices of the total economy (GDP) is calculated as follows:

total value added at basic prices of industries
plus: balance of taxes and subsidies on products
plus: difference imputed and paid VAT

VAT, taxes on imports and subsidies on re-exports cannot be attributed to individual industries. Therefore, GDP at market prices cannot be broken down completely by industry.

Value added can be valued gross (including consumption of fixed capital) or net (excluding consumption of fixed capital).

Taxes on production and imports

Taxes on production and imports are compulsory payments to the government and the European Union (EU), which are related to production, imports and to the use of production factors.

Taxes on production and imports are classified into taxes on products and other taxes on production.

Taxes on products

Taxes on products are related to the value or the volume of products. They are levied on domestically produced or transacted products and on imported products.

Taxes on products are classified into taxes on domestic products, taxes on imports and VAT.

Taxes on domestic products (excluding VAT)

Taxes on domestic products are related to the value or the volume of domestically produced or transacted products. Examples are insurance premium tax and excise duties on motor spirits and on tobacco.

Taxes on imports (excluding VAT)

Taxes on imports are related to the value or the volume of imported products. Examples are import duties and excise duties on imported fuel. Taxes on imports cannot be broken down by industry.

Imputed VAT

VAT is a tax on goods and services collected in stages by producers, which is ultimately charged in full to the final purchasers. Producers are obliged to hand over only the difference between the VAT on their sales and the VAT on their purchases. Imputed VAT is calculated by applying the VAT rates on the relevant goods and services. Relevant means that VAT is only calculated on transactions of purchasers who are not able to deduct it. Most of the VAT is therefore recorded as being paid on final uses, mainly on household consumption. A part of VAT may, however, be paid by enterprises, mainly by those, which are exempted from VAT. These enterprises do not have to charge VAT on their sales. Therefore, they cannot deduct the VAT they have paid on their purchases of intermediate and investment goods and services. In this way the VAT is at the same time the final tax.

Difference imputed and paid VAT

Imputed VAT differs from VAT actually paid to the government. This is due to acquittals, bad debts, fines, the Regulation for small entrepreneurs and VAT evasion.

The difference imputed and paid VAT is not distributed over industries. On the level of the total economy it is added to GDP (and the operating surplus / mixed income).

Other taxes on production

Other taxes on production include all taxes on production paid by producers, not related to the value or volume of products produced or transacted. Examples are real estate tax and sewerage charges paid by producers.

Subsidies

Subsidies are current payments from the government or the EU to producers with the objective to influence output prices, employment or the remuneration of production factors. Subsidies are distinguished between subsidies on products and other subsidies on production.

Subsidies on products

Subsidies on products are related to the value or the volume of products. They can be distinguished between subsidies on domestic products and subsidies on imports.

Subsidies on domestic products

Subsidies on domestic products are related to the value or the volume of domestically produced or transacted products. Examples are EU-subsidies on food products and public transport subsidies.

Subsidies on imports

Subsidies on imports are related to the value or the volume of imported products that are re-exported without undergoing any processing. These are mainly subsidies on the re-exports of dairy products.

Subsidies on imports cannot be broken down by industry.

Other subsidies on production

Other subsidies on production include all subsidies on production paid to producers, not related to the value or volume of products domestically produced or transacted. These are mainly wage subsidies.

Compensation of employees

Compensation of employees is the total remuneration paid by employers to their employees in return for work done. Employees are all residents and non-residents working in a paid job. Managing directors of limited companies are considered to be employees; therefore their salaries are also included in the compensation of employees. The same holds for people working in sheltered workshops.

Compensation of employees is distinguished between wages and salaries and employers' social contributions.

Wages and salaries

Wages and salaries include income taxes and employees' social contributions even if they are actually withheld by the employer and paid directly to tax authorities, social security schemes and pension schemes.

Besides wages that are periodically and directly paid to employees, wages and salaries also contain extra's (such as bonuses, overtime pay, tips, commission), wages in kind (such as free housing, free food, 'company car', day nursery, lower interest rates on mortgages, free travel (or at reduced prices) and holiday allowances. Furthermore, certain refunds for costs made by the employee, such as travel expenses to and from work, are included as well.

Employers' social contributions

Employers' social contributions consist of payments to insurers made by employers for the benefit of their employees. They can be classified in employers' social security contributions, employers' private social contributions (o.w. pension schemes) and the

imputed social contributions.

Most of the time the employers directly pay the employers' social contributions to the insurers. However, to show that these contributions are paid for the benefit of employees, these payments are recorded as two transactions: a) employers pay employers' social contributions to their employees, and b) employees pay the same contributions to social insurance funds.

Consumption of fixed capital

Consumption of fixed capital represents the depreciation of the stock of produced fixed assets, as a result of normal technical and economical ageing and insurable accidental damage. Losses due to catastrophes and unforeseen ageing are seen as a capital loss.

For the estimation of the consumption of fixed capital the time series of fixed capital formation are transformed into a net stock of produced fixed assets with the help of the perpetual inventory method (PIM). The consumption of fixed capital is the depreciation of the net stock of produced fixed assets during the year as far as not caused by revaluations because of price changes, new fixed capital formation or discarding of fixed assets.

This method may differ considerably from the method used to calculate depreciation in business accounts, which is based on historical costs or fiscal life span.

Operating surplus / mixed income

Gross operating surplus by industry is the balance that remains after deducting from the value added (basic prices) the compensation of employees and the balance of other taxes and subsidies on production. The operating surplus of family enterprises is called mixed income, because it also contains compensation for work by the owners and their family members.

On the level of the total economy operating surplus is computed by adding to the total of the industries the difference imputed and paid VAT.

Net operating surplus / mixed income remains after deducting consumption of fixed capital from gross operating surplus / mixed income.

2.3 Goods and services transactions (chapter Supply, use and final expenditure)

Imports and exports (valuation)

In the supply and use tables imports and exports of goods are recorded at the value at the Dutch border.

The consequences of this valuation are:

- imports of goods include the transport and insurance costs made abroad (cost-insurance-freight = cif-valuation).
- exports of goods include the transport and insurance costs made in the Netherlands (free on board = fob-valuation).

In order to assure that the balance of the exports and imports of goods and services (the export surplus) links to actual payments, which are on balance received from the rest of the world, the following rules of accounting, are handled:

- when the transport of exports in the Netherlands is carried out by a foreign freighter, the costs up to the border (included in the exports of goods) are compensated by an import of services.
- when the transport of imports in the rest of the world is carried out by a Dutch freighter, the costs abroad (included in the imports of goods) is compensated by an export of services.

On the macro level imports of goods is valued free on board at the border of the exporting country. The transition from valuation of imported goods at cif to fob consists of:

- a cif/fob adjustment of the transport costs abroad of Dutch freighters. Total imports (goods) and exports (services) are reduced by the same amount.
- a cif/fob reclassification of the transport costs abroad of foreign freighters, from imports of goods to imports of services. It leaves total imports and total exports unchanged.

Imports of goods and services

Imports of goods are goods intended for residents, which are imported from abroad into the Dutch economic territory.

Included in imports of goods are raw materials, semi-manufactured products, fuels and final products. Also included are imported goods, which are re-exported without undergoing any processing.

Imports of services include among other things the expenditures abroad by Dutch tourists, inhabitants of the border area and diplomats.

Exports of goods and services

Exports of goods are goods, which have been exported by residents from the Dutch economic territory to the rest of the world.

The exports of services include the services of Dutch transport enterprises abroad, harbour services, ships repair services and engineering of works by Dutch contractors abroad.

Also included in the exports of services are expenditures by foreign tourists, inhabitants of the border area and diplomats in the Netherlands.

Final consumption expenditure

Final consumption expenditure consists of expenditure incurred by resident institutional units on goods and services that are used for the direct satisfaction of individual needs or wants or the collective needs of members of the community. Final consumption expenditure may take place on the domestic territory or abroad.

Final consumption expenditure exists only for households, NPI households and general government.

Classification of final consumption expenditure and actual individual consumption

From an international viewpoint two different classifications are applied for the final consumption expenditure and actual individual consumption are in use: according to product groups and according to objects. The classification according to product groups represents the viewpoint of the producers; this classification is also used in the supply and use tables. The classification according to objects reflects much more the viewpoint of the consumer. Here the difference between goods and services is of no importance. For instance the object transport encompasses the purchase of vehicles as well as the purchase of transport services.

In the Dutch National accounts both final consumption expenditure and actual individual consumption by households are also classified according to goods and services categories. The specific Dutch classification can be regarded as a classification from the viewpoint of retail trade. It is really a mix of the classification according to product groups and objects.

Final consumption expenditure by households

Final consumption expenditure by households includes the following borderline cases:

- income in kind like accommodation, food, clothing etc.
- services of dwellings, which are occupied by the owners themselves and without any actual rent payments. These services are valued by applying the rents of similar dwellings.
- goods and services produced for own use, as in agriculture. The value of these products is calculated by applying the market prices for similar products.
- durable consumption goods such as private cars, household appliances, furniture and clothing. However, the purchases of dwellings by households are not seen as final consumption, but as fixed capital formation by households.

The detailed data on consumption of households concern private domestic consumption expenditure. This includes final consumption in the Netherlands by residents and non-residents. Final consumption by households can be calculated by deducting from private domestic consumption expenditure the final consumption by non-residents in the Netherlands (registered as exports) and adding final consumption by households in the rest of the world (registered as imports).

Final consumption expenditure by NPI households

Final consumption expenditure by NPI households consists of all the non-market output of this sector excluding the own account capital formation.

Final consumption expenditure by general government

Final consumption expenditure by general government results from the specific recording of government output. Only a small part of government output is actually sold (market output). The larger part of government output is paid out of public funds and provided free of charge to all sectors (non-market output). Because the allocation of government output to different users will encounter large problems, the government is by convention considered to be the consumer of its own output. Because of the absence of market prices output and final consumption expenditure by general government is calculated from the production costs:

intermediate consumption
plus: compensation of employees
plus: consumption of fixed capital
plus: other taxes on production (paid by the government)
minus: other subsidies on production (received by the government)

= output (basic prices)
minus: sales (=market output)
minus: own-account capital formation
plus: social benefits in kind via market producers

= final consumption expenditure by the government

Actual individual consumption

Final consumption expenditure by households refers to expenditure on consumption goods and services. In contrast, actual final consumption refers to the acquisition of consumption goods and services. The difference between these concepts lies in the treatment of certain goods and services financed by the government or NPI households but supplied to households as social transfers in kind.

By convention, all final consumption expenditure by NPI households and most of the final consumption expenditure by the government in the field of education, health, social security and welfare, sport and recreation and culture are treated as individual consumption.

So actual individual consumption is:

final consumption expenditure by households
plus: final consumption expenditure by NPI households
plus: individual consumption by the government
= actual individual consumption

Actual collective consumption

Services for collective consumption (collective services) are provided simultaneously to all members of the community or all members of a particular section of the community. Actual collective consumption consists in particular of government expenditures on services in the field of:

management and regulation of society.
security and defence.
law and order, legislation and regulation.
public health.
environment.
research and development.
infrastructure and economic development.

Fixed capital formation

Fixed assets are produced tangible or intangible assets that are used in the production process for more than one year.

Gross fixed capital formation consists of producers' acquisitions less disposals of fixed assets:

- acquisitions, less disposals, of tangible fixed assets:
dwellings and non-residential buildings.

- civil engineering works.
- transport equipment.
- machinery, equipment and computers.
- cultivated assets (trees and livestock).
- acquisitions, less disposals, of intangible fixed assets:
 - mineral exploration.
 - computer software.
 - entertainment, literary or artistic originals.
 - other intangible fixed assets.
- major improvements to land (reclamation, land consolidation and land preparing for building).

Fixed capital formation also includes:

- work in progress of construction such as unfinished dwellings, non-residential buildings and civil engineering works are recorded as fixed capital formation of the client.
- military structures and equipment, similar to those used by civilian producers, such as airfields and hospitals.
- improvements to existing fixed assets that go well beyond the requirements of ordinary maintenance and repairs.
- transfer costs of fixed assets, such as conveyance fees and costs made by real estate agents, architects and notaries.

On the level of the total economy and the sectors, an adjustment is made for the transactions in used fixed assets, which are seen as investments of the buyer and disinvestment of the seller. This adjustment is not made for the industries.

The registration of fixed capital formation by industry and sector is on an owner basis. That means that fixed capital formation is registered on the industry or sector which can be considered to be the economic owner of the capital goods concerned.

Changes in inventories

Inventories consist of all raw materials, semi-manufactured goods, work in progress and final products, that producers have in stock at a certain moment.

Changes in work in progress are in general considered to be changes in inventories. However, work in progress in construction is seen as fixed capital formation of the client and not as changes in inventories of the construction industry. This concerns unfinished buildings and civil engineering works.

Increases in inventories occur when goods are produced (or purchased) but not yet sold (or used) in the year under review. Decreases in inventories occur when goods are withdrawn from existing inventories in order to be sold or used in the production process.

The assessment of the changes in inventories is done in such way that gains or losses on inventories caused by price changes are avoided. With this objective the initial and final stock of each good is valued at the same price, namely raw materials at the average purchase price in the period, final products at average sales price and work in progress at the average cost price.

This valuation method prevents output and subsequently value added from being influenced by changes in prices of stocks during the period under review.

Acquisitions less disposals of valuables

This transaction consists of the acquisitions less disposals of precious stones, non-monetary gold, antiques, art objects and jewellery that are acquired and held primarily as stores of value. In the national accounts this transaction is mostly combined with changes in inventories.

2.4 Distributive transactions (chapter Sector accounts)

Compensation of employees / labour costs

Compensation of employees is the total remuneration paid by employers to their employees in return for work done. Employees are all residents and non-residents working in a paid job. Managing directors of limited companies are considered to be

employees; therefore their salaries are also included in the compensation of employees. The same holds for people working in sheltered workshops.

Compensation of employees is classified in wages and salaries and employers' social contributions.

Wages and salaries

Wages and salaries include income taxes and employees' social contributions even if they are actually withheld by the employer and paid directly to tax authorities, social security schemes and pension schemes.

Wages include payments that are periodically and directly paid to employees. Besides they contain extra's (such as bonuses, overtime pay, tips, commission), wages in kind (such as free housing, free food, 'company car', day nursery, lower interest rates on mortgages, free travel (or at reduced prices) and holiday allowances. Furthermore, certain refunds for costs made by the employee, such as travel expenses to and from work, are included as well.

Employers' social contributions

Employers' social contributions consist of payments to insurers made by employers for the benefit of their employees. They can be classified in employers' social security contributions, employers' private social contributions (o.w. pension schemes) and the imputed social contributions.

In most cases the employers directly pay the employers' social contributions to the insurers. However, to show that these contributions are paid for the benefit of employees, these payments are recorded as two transactions: a) employers pay employers' social contributions to their employees, and b) employees pay the same contributions to social insurance funds.

Taxes on production and imports

Taxes on production and imports are all taxes to the government and the EU paid by producers except for the current taxes on income and wealth.

All taxes paid by consumers are regarded as current taxes on income and wealth. So, depending on the taxpayer, the same tax is recorded as a tax on production or a tax on income and wealth. For example real estate taxes on dwellings, paid by tenants, are seen as taxes on income and wealth, while real estate taxes paid by owners of dwellings (including owner-occupiers) are seen as taxes on production.

Import duties to the EU are recorded as taxes on imports. The import duties paid by non-residents to the EU (via the government) are not recorded in the national accounts.

Taxes on production and imports are recorded according to the destination criterion. So, taxes collected by the central government on behalf of the local government or the EU are not recorded as receipts of the central government.

Subsidies

Subsidies are granted by the government and the EU to support producers, to lower the prices of their products or to increase employment. Examples are public transport subsidies, rent subsidies to owners of dwellings, EU-subsidies on food products and government contributions to loss-making public enterprises. The subsidies on food products paid by the EU to non-residents (via the government) are not recorded in the national accounts.

Interest

Interest is imputed to the period for which the underlying claim or debt has been set. Actual interest payments are corrected for imputed bank services. There is a shift from the actual interest payments to the production or the consumption of bank services. For producers of imputed bank services this means a decrease of the received interest and an increase of the paid interest with respect to the actual interest flows. For the consumers of imputed bank services this means an increase of received interest and a decrease of paid interest, compared with the actual interest flows.

Dividends

Dividends are a form of property income received by owners of shares to which they become entitled as a result of placing funds at the disposal of corporations. Dividends are recorded gross, before deduction of dividend tax. This applies also for the taxes on dividends to and from the rest of the world. Dividends are recorded at the moment they are made payable.

Withdrawals from income of quasi-corporations

Quasi-corporations have no independent legal status. However, they have an economic and financial behaviour that is different from that of their owners and similar to that of corporations. Therefore they are classified as non-financial or financial corporations.

So, public enterprises are seen as corporations, although they belong to the government. The profits of these enterprises are transferred to the government in the form of 'withdrawals from income of quasi-corporations'.

However, government contributions to loss-making public enterprises are recorded as subsidies.

Reinvested earnings on direct foreign investment

Reinvested earnings on direct foreign investment are equal to:

operating surplus of the direct foreign investment enterprise.
plus: property income and current transfers receivable.
minus: property income and current transfers payable, including actual remittances to foreign direct investors and any current taxes payable on income and wealth of the direct foreign investment enterprise.

Property income attributed to insurance policy holders

In the national accounts pension and life insurance provisions are seen as a liability of insurance enterprises to policyholders. Therefore, the investment revenues on these provisions are booked as payments from insurance enterprises to households. Subsequently, households pay back these revenues as imputed contributions to pension funds and life insurance companies. In the financial accounts the latter transaction is recorded as a component of net equity in life insurance and pension funds reserves.

Income from land and subsoil assets

Income from land and subsoil assets includes rents (received by landowners from tenants) and royalties for the permission to explore or to extract minerals or fossil fuels (received by owners of such deposits).

Current taxes on income and wealth

Current taxes on income and wealth of corporations consist of corporation tax and dividend tax. These taxes are based on the profits of corporations.

Current taxes on income and wealth of households include all taxes, which are periodically imposed on income and wealth, such as the income tax, the wage tax, and the tax on net wealth of individuals. Non-periodical levies, such as inheritance tax are defined as capital transfers. Several types of taxes are simultaneously seen as taxes on production and imports when imposed on producers, and as taxes on income and wealth when imposed on consumers. For instance, motor vehicle tax is a tax on production when it is imposed on company cars and it is a tax on income and wealth and imports when it is imposed on cars for private use.

The treatment of dividend tax results from the recording of dividends. Because dividends are recorded gross, i.e. before deduction of dividend tax, dividend tax is in all cases recorded at the receiving sector. The same applies for the dividend tax to and from the rest of the world.

Social contributions

Social contributions include social security contributions, private social contributions (o.w. contributions to pension schemes) and

imputed social contributions. Employers, employees, self-employed persons and non-active persons pay these contributions.

Actually, the employers' part is paid directly to the insurers. However, in the national accounts, the employers' contributions are supposed to be part of primary income of households (i.e. the income from direct participation in the production process). Therefore, in first instance these contributions are treated as payments by employers to households as compensation of employees, who are deemed to pay them to the insurers in the income account.

Social security contributions

These are contributions from households to social security funds.

Contributions to pension schemes

Contributions to pension schemes are based on collective contracts with pension funds and life insurance companies.

The contributions are calculated as follows:

actual contributions to pension schemes (gross)
minus: compensation of insurance services (part of consumption of households)
plus: supplement from investment income
= contributions to pension schemes

The supplement from investment income is part of the property income attributed to insurance policyholders that relates to pensions.

Other private social contributions

These are contributions paid to private social schemes excluding pension schemes. The contributions to these schemes can be derived in the same way as the contributions to pension schemes.

Imputed social contributions

Imputed social contributions represent the counterpart to the 'unfunded employee social benefits' (less any employees' social contributions) paid directly by employers to their (former) employees. It is necessary to introduce this imputation because the direct payments are recorded twice. Firstly they are recorded as employers' social contributions (part of the compensation of employees). Secondly they are recorded as social benefits.

Social benefits

Social benefits are transfers to households, intended to relieve them from the financial burden of a number of risks or needs, such as sickness, invalidity, disability, old age, survivors and unemployment.

Social benefits are classified in social security benefits, social assistance benefits, private social benefits (o.w. pension benefits) and unfunded employee social benefits.

Social security benefits

Social security benefits are paid by social security funds, in the field of unemployment, disability, sickness, old age etc.

Social assistance benefits

Social assistance benefits are payments of the central and local government to households, for which no quid pro quo by the beneficiary is expected. These benefits are based on a number of Dutch laws, such as the National Assistance Act and the Social Employment Act.

Pension benefits

Pension benefits are private social benefits in the field of old age, survivors or disability, paid by pension funds and life insurance companies.

Other private social benefits

These are benefits paid by employers out of special reserves, which are segregated from their other reserves.

Unfunded employee social benefits

These social benefits are directly paid by employers to their (former) employees, without involving any social security fund. Examples are the continuation of wages in case of illness and military pension provisions.

Non-life insurance premiums

Non-life insurance premiums comprise both the actual premiums payable by policyholders to obtain insurance cover during the accounting period, and the premium supplements payable out of the property income attributed to insurance policy holders, after deducting the compensation of insurance services. These premiums provide cover against damage as a result of fires, floods, crashes, collisions, sinkings, theft, violence, accidents, sickness, etc.

As the compensation of insurance services of non-life insurance enterprises is calculated by subtracting the claims from the premiums (actual premiums and premium supplements), it follows that the total non-life insurance premiums must equal the total non-life insurance claims of the insurance enterprises.

Non-life insurance claims

Non-life insurance claims represent the amounts which insurance enterprises are obliged to pay in settlement of injuries or damage as a result of fires, floods, crashes, collisions, sinkings, theft, violence, accidents, sickness, etc.

Other current transfers n.e.c.

This transaction includes all transactions not mentioned before, which do not have the character of a capital transfer. This concerns particularly the current transfers within the general government.

Adjustment for net equity in pension funds reserves

Since households are treated in the financial accounts as owners of the pension funds reserves an adjustment item is necessary to ensure that any excess of contributions to pension schemes over pension benefits does not affect household savings:

contributions to pension schemes
minus: pension benefits

= adjustment for net equity in pension funds reserves
This adjustment is also made for the claims of non-residents on the reserves of Dutch insurance companies.

Capital transfers

Capital transfers are payments for which no quid pro quo by the beneficiary is expected. They burden the wealth of the payer, or are meant to finance fixed capital formation or other long-term expenditures of the receiver. Capital transfers can be classified into investment grants, capital taxes, other capital transfers and imputed capital transfers.

Investment grants

Investment grants are capital transfers, which are intended to finance fixed capital formation of other units.

Capital taxes

Capital taxes are compulsory, non-periodical payments to the government. They are based on the wealth of taxable persons. In practise, they only cover the inheritance tax. Taxes on net wealth of individuals are imposed periodically and are therefore recorded as taxes on income and wealth.

Other capital transfers

Other capital transfers are capital transfers that cannot be characterised as investment grants or as capital taxes.

Imputed capital transfers

Contributions by the government meant to increase the pension schemes reserves are recorded as other capital transfers of the government to insurance corporations and pension funds. Sub-

sequently, these amounts are imputed to households by way of an imputed capital transfer from the insurers to the policyholders. Eventually, the amounts are paid back to the insurers as a component of the change in the net equity of households in the pension schemes reserves (financial transaction).

Acquisitions less disposals of non-produced non-financial assets

Acquisitions less disposals of non-produced non-financial assets mainly consist of sales of land by public (municipal) development corporations to investors in dwellings and non-residential buildings. The valuation of sales and purchases of land is exclusive of VAT and transfer costs. These are included in fixed capital formation.

2.5 Financial transactions (chapter Sector accounts)

General

Financial transactions are changes in financial assets and liabilities to other sectors and the rest of the world. In general, these changes in assets (or liabilities) are measured as the difference between provided (or attracted) financial resources and redemptions. However, the value of transactions in securities such as shares and bonds is determined as a balance of all purchases (in the case of changes in assets) and as a balance of all sales (in the case of changes in liabilities). Revaluations, for example as a consequence of changes in exchange rates, are not recorded as financial transactions.

Financial transactions may have the following causes:

- the financial transaction is the consequence of a current or a capital transaction. Both transactions are recorded at the same moment against the same value.
- the financial transaction is the result of another financial transaction. Both transactions are also recorded at the same moment against the same value.

In grouping the financial transactions, efforts have been made to combine two points of view:

- the character and the form of the relevant transactions. In this way a picture arises of the developments of a number of market segments for the money and capital market.
- the maturity and transferability of assets and liabilities. This is important for judging liquidity and solvability of a sector.

Monetary gold and special drawing rights

Monetary gold includes all gold, which is not intended for industrial purposes and not held in the form of valuables. By convention monetary gold is seen as a liability of the rest of the world. Monetary gold can only be held by DNB.

The special drawing rights (SDR's) consist of the international reserve assets created by the IMF. As a financial asset, this transaction only exists for the Dutch Central Bank (DNB).

Currency

Currency consists of notes and coins in circulation that are commonly used to make payments. As a liability, this transaction only exists for the central government (issuing of coins), the monetary financial institutions (DNB, issuing of bank notes) and the rest of the world (foreign currency). The deposits on smart cards, etc. are not part of the currency.

Transferable deposits

Transferable deposits include all deposits in euro's and foreign currency with resident and non-resident banks which are repayable on demand, immediately and without restriction by cheque, standing order or by other means (deposits on smart cards). As a liability, this transaction only exists for monetary financial institutions and the rest of the world.

Savings deposits in euro's

These savings deposits include all deposits in euro's of both residents and non-residents in the form of normal saving ac-

counts, fixed saving accounts, premium saving accounts and fixed-term saving accounts.

Other deposits

Other deposits include all deposits in euro's and foreign currency at any resident and non-resident bank (except for saving deposits in euro's), which are not immediately transferable without restrictions. As a liability this transaction only exists for monetary financial institutions and the rest of the world.

Bills and short-term bonds

Bills and short-term bonds are all securities with a maximum term of one year, which in principle are transferable against a price that has been fixed in advance. Usually, the obliged interest payments of the debtor have been discounted in the value. 'Transferable' means that assets can be converted into cash from, or on a date that has been appointed at the moment the bond was issued.

This transaction covers treasury paper issued by both the Dutch government and foreign governments, saving certificates to bearer and transferable certificates of deposits, issued by banks.

Long-term bonds

Long-term bonds are all transferable securities, which generally do not mature within one year. They are usually quoted at the stock exchange. The interest on long-term bonds is made payable through coupons. Mortgage bonds, notes issued by banks and convertible bonds as long as they have not been converted into shares, also belong to this type of assets.

Short-term loans

Short-term loans are all credits, which do not have the characteristics of deposits and which mature by contract within one year. Included are short-term loans from financial institutions, balances on current accounts (except transferable deposits), short-term consumer credit, bills (of exchange) and promissory notes.

Long-term loans

Long-term loans are all credits, which do not have the characteristics of deposits and which do not mature within one year. They mainly concern long-term loans on obligations, mortgage loans and long-term consumer credit.

Shares and other equities

Shares and other equities are all claims, which are -fully, or partly- entitled to a share in profits or in the own funds in case of liquidation. Included is the value of capital formation by the government in public enterprises (quasi-corporations) that belong to the government.

Net equity of households in pension funds reserves

The net equity of households in the pension funds reserves of resident pension funds and life insurance companies is seen as a financial asset that belongs to resident and non-resident households.

The net equity of households in the pension funds reserves is built up as follows:

actual contributions to pension schemes (gross)
minus: compensation of insurance services (=consumption)
plus: supplement from investment income

= contributions to pension schemes
minus: pension benefits
plus: imputed capital transfers

= net equity of households in pension funds reserves

Net equity of households in life insurance reserves

The net equity of households in the life insurance reserves of resident and non-resident pension funds and life insurance companies is seen as a financial asset that belongs to resident

and non-resident households.

The net equity of households in the life insurance reserves is built up as follows:

actual life insurance contributions (gross)
minus: compensation of insurance services (=consumption)
plus: supplement from investment income

= life insurance contributions
minus: life insurance benefits

= net equity of households in life insurance reserves

Other insurance technical reserves

Other insurance technical reserves are financial assets of the beneficiaries that may belong to any sector. They consist of:

- prepayments of insurance premiums i.e. premiums payable in the current accounting period intended to cover risks outstanding during the following period.
- reserves for outstanding claims held by insurance corporations in order to cover the amounts they expect to pay out in respect of claims that are not yet settled.

Other accounts receivable and payable (net)

The transactions in the sector accounts are mainly recorded at a moment that does not coincide with the moment the transaction is completed. These time differences cause changes in assets and liabilities, which are recorded in the transaction 'other accounts receivable and payable'.

For example, sales are recorded at the moment of delivery. At that moment, a claim of the supplier on the buyer (suppliers credit) arises, which is nullified when the buyer pays. Other examples are payments in advance on deliveries (buyer's credit) and due payments or receipts of wages and salaries, interests, contributions etc.

Due to lack of sufficient information, it is impossible to distinguish for any of the sectors the changes in assets on one hand and the changes in liabilities on the other hand. Therefore this transaction is recorded as a 'net' liability for all sectors.

2.6 The balancing items in the sector accounts

Domestic product / value added

Value added (basic prices) by sector is equal to the difference between output (basic prices) and intermediate consumption (purchasers' prices).

The total value added at basic prices of all sectors plus some transactions which cannot be attributed to sectors, is equal to total income generated in the Netherlands or gross domestic product (GDP). The undistributed transactions include taxes less subsidies on products.

National Income / primary income

Part of GDP flows to the rest of the world (wages and salaries to non-resident employees, interests and dividends to non-resident financiers), while income generated in the rest of the world is transferred to the Netherlands. National income is the sum of GDP and net primary income from the rest of the world.

Disposable income

Disposable income is the balancing item of the secondary distribution of income account. It shows for each sector its disposable income, which remains after the redistribution of primary income by compulsory or non-compulsory current transfers between the sectors.

Total disposable income of all resident units is called disposable national income, which is equal to national income plus net current transfers received from the rest of the world.

Saving

Saving is the difference between disposable income and final consumption expenditure. In the national accounts households are treated as owners of life insurance and pension funds re-

serves. Since contributions to pension schemes and pension benefits are recorded in the secondary income account, an adjustment item (adjustment for net equity in pension funds reserves) on the use of income account is necessary to ensure that any excess of contributions to pension schemes over pension benefits does not affect household saving.

Surplus of the nation on current transactions with the rest of the world

The surplus of the nation on current transactions consists of:

- net exports, the difference between exports and imports of goods and services.
- net primary income from the rest of the world: compensation of employees, taxes on production and imports, subsidies and property income, such as interest and dividend.
- net current transfers from the rest of the world, such as dividend tax, social security benefits and other current transfers.

The surplus of the nation on current transactions deviates from the surplus on the current transactions according to the Balance of payments on a transaction basis drawn up by Dutch Central Bank (DNB), in co-operation with Statistics Netherlands. The discrepancies between the two balancing items are caused mainly by differences in definitions and measurement.

Net lending (+) or net borrowing (-)

Net lending (+) or net borrowing (-) shows the amount a sector can lend / invest or has to borrow, given the current and capital transactions in the sector accounts.

EDP-deficitThe EDP-deficit is the net borrowing of the government as defined in the National accounts plus the interest advantage / less the interest disadvantage that the government has from interest swaps which she has arranged. The EDP-deficit is one of the parts of the Stability and growth pact.

EDP-debt

The EDP-debt is the consolidated, nominal debt of the government. The EDP-debt is one of the parts of the Stability and growth pact.

Changes in financial net worth

Changes in financial net worth as established from the financial transactions, equal all changes in financial relations of one sector with other sectors or with the rest of the world. Basically, this balance equals net lending (+) or net borrowing (-). However as a consequence of using various sources for current and capital transactions and for financial transactions statistical discrepancies will appear.

3. Supply, use and input-output tables

3.1 Introduction

This publication presents a supply table (table G 0.1), a use table (table G 0.2) and an input-output table (table P 0.1) for 2002. Below an explanation is given of the contents of these tables; also the mutual relations are shown.

3.2 Supply table

The supply table (table G 0.1) describes the supply of different kinds of product. A distinction is made between domestic output by industry (column 1-25) and imports (column 27).

A row in the supply table describes the supply of a particular product. For example cell 1,1 shows the output of agricultural products of agriculture. Cell 1,27 shows the imports of these products.

A column in the supply table describes the total output of an industry by kinds of product. For example column 3 shows the output of the food industry of food products, metal products, business services and contract workers etc.

3.3 Use table

The use table (table G 0.2) describes the use of different kinds of product. A distinction is made between intermediate consumption by industry (column 1-25) and final expenditure (column 27-32). Final expenditure is broken down into exports, final consumption expenditure by households, final consumption expenditure by general government, gross fixed capital formation and changes in inventories.

A row in the use table describes the destination of each product. For example cell 1,3 shows the intermediate consumption of agricultural products by the food industry. The export of these products is recorded in cell 1,27.

By definition, the total of each row in the use table (column 35) is equal to the corresponding row total in the supply table (column 32). Some additional columns are introduced in order to make up for the differences that result from different valuation methods applied in the supply and use tables (see 3.5).

A column in the intermediate section of the use table shows the products used (row 1-45) and the value added generated (row 47-51) in the production process of an industry. For example cell 46,3 shows the total intermediate consumption of the food industry. The gross value added of this industry (at basic prices, see 3.5) can be found in cell 52,3. The total of each column in the use table (row 56) equals by definition the corresponding column total in the supply table (row 46).

3.4 Input-output table

Supply and use are also shown in the input-output table (table P 0.1). However, there is no break down by product, but by industry of origin and by imports. This discloses the relations between suppliers and users. The input-output table is derived from the supply and use tables.

A row of the input-output table represents the output by industry, broken down by category of destination: intermediate consumption by industry and final expenditures. A column in the intermediate section shows from which industries (or imports) the intermediate consumption of an industry originates. For example cell 1,3 shows the intermediate consumption of products of agriculture by the

food processing industry, while total imports of that industry is shown in cell 27,3.

The input-output table also contains value added by industry (row 33-39) and final expenditure by industry of origin (column 27-32). The output of trade and transport margins is recorded in column 33. This column equals to row 45 of the supply table. A full allocation of margins by industry is not possible, since it is generally unknown which products are involved and which destination they have. Therefore, trade and transport margins are recorded in a separate row (31) and a corresponding column (33) (see 3.5).

3.5 Valuation

For domestic products there are three kinds of valuation. The *purchasers' price* is the price of a product paid by the purchaser, excluding VAT. However, the producer of the product receives a lower amount. The difference is made up by the trade and transport margins on products. The amount received by the producer is called the *producers' price*. However, when the producer pays taxes on products (such as excises) or receives subsidies on products, he is ultimately left with the so-called *basic price*.

For imported products there are two kinds of valuation, *purchasers' price* and *cif-price*, the price at the Dutch border.

Valuation types of domestic output

purchasers' price
minus: trade and transport margins

=
producers' price
minus: taxes on products
plus: subsidies on products

=
basic price

Valuation types of imported products

purchasers' price
minus: trade and transport margins in the Netherlands
minus: taxes on imports
plus: subsidies on imports

=
cif-price

The three types of tables in this series are valued differently.

In the *use table* domestic output and imports are valued in *purchasers' prices*.

Non-deductible VAT is entered in a separate row (row 45).

In the *supply table*, domestic output is valued at *basic prices* and imports at *cif-prices*.

The totals for trade and transport margins and taxes and subsidies on products can be found in column 29, 30 and 31. In this way, the total of each product in the supply table equals the corresponding total in the use table.

Row 47 and 48 of the supply table show the taxes and subsidies on products by industry. By definition, the totals of these rows are equal to the corresponding column totals (30 and 31).

In the *input-output table*, domestic output is valued in *producers' prices* and imports at *cif-prices*.

Trade and transport margins on purchased goods are shown in row 31. In row 28 the taxes on imported products are recorded; import duties are included here. Finally, row 29 contains the subsidies on re-exports.

3.6 Relation between use table, input-output table and macro-totals

Some rows and columns have been added to the use table and the input-output table in order to link them to the macro-aggregates.

Sales of used fixed capital goods

The stock of fixed capital goods will be increased by purchases of newly produced and imported fixed capital goods and diminished by sales of used fixed capital goods. Sales are recorded in the column 'fixed capital formation'. The counter-entries are exports, in case of sales to the rest of the world, or final consumption expenditure by households, in case of sales to households. Imports of used fixed capital goods have been completely allocated to fixed capital formation.

Final consumption by non-residents in the Netherlands

Private final consumption expenditure in the Netherlands also includes consumption by non-residents, for example their holiday expenditures in the Netherlands. These expenditures are excluded from final consumption expenditure by households with the help of a correction in one entry. A counter-entry is made under exports.

Final consumption by households in the rest of the world

The opposite of consumption by non-residents in the Netherlands is the final consumption by Dutch households in the rest of the world. Final consumption expenditure by households has been adjusted for these expenditures. In a separate column 'final consumption by households in the rest of the world' a counter-entry has been made on imports.

Difference between paid and imputed VAT

Non-deductible VAT is estimated on the basis of underlying transactions and charged tariffs. This VAT-amount, called the imputed VAT, must be transferred by the enterprises to the central government. However, the actual receipts by the government are not equal to this amount due to fines, discharges, acquittals and bad debts. The non-paid VAT is added to the operating surplus in a separate column called 'paid minus imputed VAT'. Therefore, the total of row 'non-deductible VAT' is the amount received by the government.

<p>The tables in this publication are highly aggregated. More detailed supply and use tables and input-output tables are available on application (see the colophon). The tables have been compiled both in current prices and prices of the previous year.</p>

4. Sectors in the sector accounts

4.1 Introduction

The sector accounts present in successive accounts a review of all economic processes, like production, income distribution and financing. These accounts are not only compiled for the national economy as a whole, but also for different domestic sectors. In this way the sector accounts describe:

- for each economic process the role of each sector, for instance general government in the income redistribution and credit institutions in financing.
- for each sector all economic transactions and their relation with other domestic sectors and the rest of the world.

Five sectors are distinguished: non-financial corporations, financial corporations, general government, households and NPI households. These sectors are clarified in section 4.2.

In the supply and use tables and the input-output tables producers are classified by industry. The relation between sectors and industries is explained in section 4.4.

4.2 The sectors in the sector accounts

The sector accounts describe the transactions of Dutch economic units with other economic units, Dutch as well as foreign. The Dutch economic units include all corporations established in the Netherlands, all Dutch government institutions in the Netherlands and abroad and all resident natural persons.

Corporations contain all incorporated enterprises and some unincorporated enterprises. Examples of these unincorporated enterprises (quasi-corporations) are public transport companies and large family enterprises. Foreign enterprises settled in the Netherlands are also considered as Dutch corporations. On the other hand affiliates of Dutch enterprises in foreign countries are not recorded as Dutch corporations.

All corporations and quasi-corporations only pertain to the sectors non-financial corporations and financial corporations.

Non-financial corporations

The sector non-financial corporations consists of all (quasi-) corporations which are principally engaged in the production of goods and marketable non-financial services.

Non-financial corporations include:

- all corporations, quasi-corporations and co-operative organisations which do not belong to the financial corporations.
- all NPI households which do not pertain to the other sectors. Examples are old people's homes, hospitals and housing corporations.
- public enterprises, which are fully or partly owned by the government, like Dutch Railways (NS).

Financial corporations

This sector consists of all (quasi-) corporations which are principally engaged in intermediation (acquisition, transformation and distribution of financial means) and insurance (conversion of individual into collective risks).

This sector consists of three subsectors: monetary financial institutions, insurance corporations and pension funds and other financial institutions.

Monetary financial institutions include:

- the Dutch Central Bank (DNB).
- banks which are legally obliged to report to DNB due to supervisory legislation. This group includes general banks, savings banks and mortgage banks.

Insurance corporations and pension funds include:

- all institutions under supervision of the Insurance Supervisory Board like pension funds, life and non-life insurance enterprises and saving funds.
- institutions not under supervision of the Insurance Supervisory Board like Early Retirement funds and reinsurance corporations.
- privately organised social insurance institutions. These institutions execute social insurance schemes outside the sphere of influence of the government, like the Riskfund for construction and various medical health arrangements for specific professional groups like local civil servants and policeman.

Other financial institutions include:

- investment trusts.
- institutions, which do not have to report to DNB, like autonomous financing and lease companies, municipal credit banks, regional development companies.
- financial auxiliaries like the Amsterdam Stock Exchange, the European Option Exchange, credit card organisations and credit and mortgage intermediation services.
- financial auxiliaries like insurance agents, guarantee funds, pension consultancies and insurance exchanges.
- holdings of monetary financial institutions, insurance corporations and pension funds, which are not under supervision themselves.
- special purpose entities.

Not included in the sector financial corporations are:

- legally autonomous investment trusts which are held by one or more owners, who themselves do not belong to any financial corporation. These are included in the sector to which the owner belongs.
- non-supervised pension funds aimed at pension insurance of one single person. These are included in the sector households.
- unincorporated financial auxiliaries. These are included in the sector households.

General government

The sector general government consists of all units, which mainly are controlled and financed by the government. These units consist only of non-market producers. All Dutch government institutions belong to this sector, even if they are active abroad, like embassies. On the other hand foreign embassies and international institutions, like Europol and the International Court of Justice, do not belong to the Dutch government. Corporations form no part of the government sector, even when they are partly or fully owned by government institutions, as is the case for the Dutch Railways (NS), Amsterdam Airport (Schiphol) or the Central Bank (DNB).

The general government sector is split up into three subsectors: central government, local government and social security funds.

Central government includes:

- the state (ministries and some budget funds like the Municipal Budget Fund, the Province Budget Fund and the Infrastructure Fund).
- universities.
- public corporate organisations like commodity boards.
- a group of national foundations and organisations.

Examples of national foundations and organisations are:

- research institutions linked to universities.
- charity, relief and educational organisations that are controlled and mainly financed by the government (NOVIB).
- privatised national government services.
- other institutions such as the Open University.

Local government includes:

- provinces and district water boards.
- municipalities, excluding their quasi-corporations like public transport companies.
- joint ventures of municipalities in the field of waste processing, water treatment, fire brigades, social work provision, etc.
- privatised government services like employment service offices and regional police forces.
- local private law institutions, like schools for special education, museums, public libraries, the Youth Work Guarantee Plan and asylums.

Social security funds include:

- supervisory and executive bodies for social security regulations, Supervisory Board for Health Care Insurance (CTZ), Health Care Insurance Board (CVZ), Social Insurance Bank (SVB), Social Security Agency (UWV).
Starting with 1998 they also encompass the people, employed by the central government, who are covered by statutory disablement regulations, including the implementation organisations.
- social security funds for the execution of the Compulsory Pension Funds Act, the Unemployment Insurance Act, etc.

Households

The sector households consists of all natural persons who are resident for more than one year in the Netherlands, irrespective of their nationality. On the other hand Dutch citizens who stay abroad for longer than one year do not belong to the Dutch sector households.

The sector households does not only cover independently living persons, but also persons in nursing homes, old people's homes, prisons, boarding schools, etc.

If persons are entrepreneurs, their business also belongs to the sector households. This is the case for self-employed persons and owner-occupiers of dwellings. On the other hand, large autonomous unincorporated enterprises (quasi-corporations) are included in the sector non-financial or financial corporations.

NPI households

The sector NPI households consists of foundations and clubs whose resources are principally derived from voluntary contributions from households and from property income. Examples are religious organisations, charity organisations, political parties, trade unions and cultural, sports and recreational organisations.

4.3 The relation between sectors and industries

Below, the content of the sectors in the sector accounts is compared with the contents of the industries in the supply, use and input-output tables.

Non-financial corporations

The sector non-financial corporations consists of all economic units which are not included in other sectors.

Financial corporations

The sector financial corporations consists of all economic units in the industries banking, insurance and pension funding and activities auxiliary to financial intermediation, except financial units that are not under supervision and work for a non-financial corporation in which they participate.

This sector also includes other industries, such as:

- operational lease companies belonging to a financial institution (industry renting of movables).
- holdings of monetary financial institutions, insurance corporations and pension funds, which are not supervised themselves (industry legal and economic activities).
- employers' organisations, trade unions and professional organisations linked to financial institutions (industry other service activities n.e.c.).

General government

The sector general government includes all the units in the industries public administration and social security, defence activities and subsidised education. The government also encompasses units, which belong to other industries such as:

- specific activities of municipalities as cleansing services (industry sewage and refuse disposal services), social workshops (industry other manufacturing), medical services (industry health and social work activities) and joint ventures of municipalities for these activities.
- employment service offices and the Youth Work Guarantee Plan (industry activities of employment agencies).
- research institutions linked to universities (industry research and development).
- ProRail (industry supporting transport activities).
- reception centres, for instance, for people seeking asylum (industry health and social work activities).
- charity, relief and educational organisations (industry other service activities n.e.c.).

Households

The sector households consists of all natural persons including their business activities (self-employed people and owner-occupiers of dwellings). Owner-occupiers are part of the industry real estate activities. In principle, self-employed people can occur in every industry, except for the industries, which carry out specific government activities.

NPI households

Foundations and clubs, which belong to the sector NPI households, can be found in the industries health and social work activities, recreational, cultural and sporting activities and other service activities n.e.c.

5. Accounts in the sector accounts

5.1 Introduction

Sector accounts present a coherent review of all economic processes and the roles played by the various sectors. Each economic process is described in a separate account. The accounts describe successively production, generation of income, primary and secondary income distribution, final consumption, redistribution by means of capital transfers, capital formation and financing.

The accounts register economic transactions, distinguishing between uses and resources, with a special item to balance the two sides of each account. By passing on the balancing item from one account to the next a connection is created between subsequent accounts.

These accounts do not only exist for the total economy, but they are also compiled for separate domestic sectors. In this way the sector accounts describe:

- for each economic process the role of each sector, for instance general government in the income redistribution and credit institutions in financing.
- for each sector all economic transactions and their relation with other domestic sectors and the rest of the world.

The accounts of 'transactions of the rest of the world with the Netherlands' are the mirror image of the accounts for the national economy. They are presented from the point of view of the rest of the world and contain only a current account, a capital account and a financial account. The current account includes imports, exports and income transactions.

The successive accounts are explained in more detail below.

5.2 The accounts

Production account

The production account shows the transactions, which are related to the production process. The output is registered as a resource, the intermediate consumption as a use. The balancing item of this account for the individual sectors is gross value added at basic prices.

The production account of the total economy is the total of the production accounts of the sectors plus the transactions for which there is no sectoral distribution available (taxes and subsidies on products). The balancing item of the production account for the total economy is GDP at market prices.

Income account: generation of income

This account describes the transactions by means of which the value added at basic prices is distributed to labour (compensation of employees), capital (consumption of fixed capital) and government (the balance of taxes and subsidies on production). The balancing item of this account is the operating surplus. The balancing item for the sector households is called mixed income, because apart from operating surplus it also contains compensation for work by self-employed persons and their family members. Net operating surplus / net mixed income remains after deducting consumption of fixed capital.

Income account: primary income distribution

This account records as uses the income from direct participation in the production process as well as property income received in exchange for the use of financial resources, land and other intangible assets. In addition, this account records the taxes on production and imports received by the government. On the resources side the paid property income is registered, as well as the subsidies paid by the government.

On this account the paid and received interest are registered exclusive of the imputed bank services. The interest which is received or paid for bank services is included in the production account.

In the national accounts insurance technical reserves are seen as a liability of insurance enterprises and pension funds to policyholders. Therefore, the receipts from investing these reserves are booked as payments from insurance enterprises and pension funds to households, in the form of property income attributed to insurance policy holders.

The balancing item of this account for each sector is primary income. The primary income for the total economy is the national income.

Income account: secondary income distribution

The secondary income account shows how primary income is redistributed by means of current taxes on income and wealth, social contributions (among which contributions to pension schemes), social benefits (among which pension benefits) and other current transfers.

The balancing item of this account is disposable income. For the consuming sectors (households, NPI households and general government) this item is passed on to the use of income account. For the other sectors the disposable income is equal to savings. This is passed on to the capital account.

Income account: use of income

This account shows which part of disposable income is spent on final consumption and which part is saved. As mentioned above final consumption only exists for households, NPI households and general government.

The net equity of households in pension funds and life insurance reserves is seen as a financial asset that belongs to households. Changes in these reserves need to be included in the savings of households.

However, contributions to pension schemes and pension benefits have already been recorded on the secondary income account (as social contributions and social benefits). Therefore, an adjustment is needed to include the change in pension funds reserves on which households have a definite claim, in the savings of households. This adjustment is called 'adjustment net equity in pension funds reserves'.

There is no need for a similar adjustment concerning life insurance because life insurance premiums and benefits are not recorded as current transactions.

Capital account: capital transfers

On this account the capital transfers are recorded.

Capital account: capital accumulation

On this account gross fixed capital formation, changes in inventories, acquisitions less disposals of valuables and non-produced non-financial assets are recorded among the uses. The decline in the value of fixed capital goods caused by consumption of fixed capital goods is recorded among the resources.

The balancing item is net lending (+) or borrowing (-). It shows the amount a sector can lend / invest or has to borrow given the current and capital transactions in the sector accounts.

Financial account

The financial account of a sector provides a detailed review of the change in the financial relations with the other sectors and the rest of the world. Therefore the financial account is a logical extension of the current and capital accounts. The financial relation between a sector and the other sectors and the rest of the world can be broken down into assets and liabilities, both with a large variety of

financial titles. Change in the assets and liabilities are financial transactions.

Theoretically, the balancing item of the financial account, 'change in financial net worth', is equal to 'net lending / net borrowing'. However, due to the use of different sources, statistical discrepancies occur.

5.3 Statistical discrepancies

The sector accounts can give a complete and fully consistent description of the total economy. Consistency implies that:

- a transaction that is recorded as a use in one sector is recorded as a resource in another sector and vice versa. Consequently, for each transaction the total of uses equals the total

of resources. This is called the transaction-identity. A special case is the identity of total supply (output and imports) and total use (intermediate consumption, final consumption expenditure, capital formation and exports).

- all available means of a sector are also used by that sector. This is called the budget-identity. This identity implies that, theoretically, for each sector total resources and change in liabilities equals total uses and change in assets.

In the sector accounts the transaction-identity is fully satisfied. However, it is not yet possible to meet the budget-identity. Maintaining this identity would require adjustments of the estimates, which cannot be justified by the available data sources. For this reason there has been chosen to allocate statistical discrepancies to the financial accounts.

6. SAM-accounts

6.1 Introduction

The sector accounts do not show detailed data on the production process and the supply and use of goods and services. On the other hand, supply and use tables do not present a review of economic processes like income distribution and financing.

Both the sector accounts and the supply and use tables fulfil a specific function in the national accounts. Besides this it is desirable to present the whole system of national accounts in one framework. A presentation in the form of a matrix is obvious, especially because it allows the inclusion of supply and use tables. Furthermore, a matrix presentation offers the possibility to choose for each constituent part of the economic process the most relevant type of unit and the most relevant classification of units. In this way, it becomes possible to show the relations between the different kinds of transactions in the economy.

In the so-called National Accounting Matrix (NAM) the whole system of national accounts is presented in one, overall framework. This NAM gives a good overview of the relations between the macroeconomic aggregates. For example, the relations between the main domestic and national economic indicators like gross domestic product (GDP), net national income (NNI), disposable income and the surplus of the nation on current transactions can be derived directly from this table.

In the NAM the core system of the national accounts is represented in a matrix format. One of its features is its opening to select the best suitable units for every constituent part of the economic process. This allows for flexibility, which implies that the matrix can be extended as required to one's needs. The Social Accounting Matrix (SAM) is an example of such an extension, in which the emphasis is put on the role of individual persons and households in the economy.

6.2 A brief description of the SAM

The core system of national accounts provides a good overview of important economic aggregates. However, not all information relevant for evaluating economic performance can be found in this system such as employment, distribution of income, spending patterns, etc. Although this type of information is often available on a meso-level, it usually has not been included into one macro-framework. The SAM has been developed in order to fill this gap.

In the SAM, relations are established between the supply and use table (with its emphasis on production and income generation) on the one hand and the sector accounts (with their emphasis on the distribution of income, expenditures and on financing) on the other. The main goal of the SAM is to provide information about different categories of labour and households. This manifests itself in a breakdown of the household sector and a detailed presentation of the labour market. Hence, an integral description of the circular flow of income on the meso-level originates, fitting consistently into the macro-economic context.

For the compilation of the SAM, three statistical systems have been used: the national accounts, the labour accounts and the socio-economic accounts. The labour market data in the SAM are based on the labour accounts; detailed information on households is taken from the socio-economic accounts. The three statistics have been combined in such way that the resulting system is consistent with the national accounts figures.

The labour market is portrayed by distinguishing employees by gender and (six levels of) education. For each industry wages and salaries and wage rates are included, broken down into twelve labour categories. In this way insight is gained in the use of labour by industry as well as the supply of different kinds of labour by groups of households.

The households themselves have been distinguished into fourteen categories. This breakdown is based on their main source of income and on the composition of the household. For a comprehensive review of the classifications applied in the SAM, see National Accounts Occasional Paper NA-68.

6.3 SAM-accounts

The SAM contains a large amount of detailed socio-economic information, in which it offers a much better understanding of the interrelations between the transactions of a large number of household groups, product groups, industries and the like. The presentation of this information in a matrix has the disadvantage that, because of its size, publication is only possible on an aggregated level. Much detailed information can't be shown. For that reason is in this publication chosen for a presentation of some tables of the SAM.

Table S 1 describes the generation of income distinguished into gender and education. This concerns the allocation of value added created in the industries over the different production factors. The factor payments for labour are particularly important in the SAM. They are recorded as a transaction (work in exchange for money) between employer (classified by industry) and employee (classified by gender and education). Table S 1 describes the corresponding cell of the SAM.

Table S 2 shows a large part of the resources and uses of ten household categories. The classification of the categories of households is based on their main source of income (wages and salaries, mixed income, income in connection with old age), and the composition of the household (single and multi person households and the last one with and without minor children). The starting point of the table is the allocation of primary income. For the various categories of households this represents the income they have generated by their active participation (as employee or own-account worker) in the production process. Also the receipts and expenditures of primary income are recorded here.

After this the transactions of the redistribution of income account are presented. The redistribution of income shows the process of redistribution of income by social contributions and benefits and other income transfers. The results of government policy on disposable income of the various groups of households are reflected here. This disposable income for each group of household is presented as a balancing item.

At last the final consumption for the groups of households is shown. Net saving is the result of disposable income minus the final consumption. For an explanation of the transactions is referred to explanation 2.

In table S 3 the final consumption by the various groups of households is divided among the goods and services categories. The households themselves are distinguished into categories based on their main source of income: wages and salaries, mixed income and income in connection with old age. Households with wages and salaries as the main source of income are distinguished into single and multi person households. The last one with and without minor children.

Finally, table S 4 describes the matrix of social benefits and other social transfers of the SAM. Six sectors are distinguished, with a subdivision of the household sector into categories based on their main source of income: wages and salaries, mixed income and income in connection with old age. Households with wages and salaries as the main source of income are distinguished into single and multi person households. The last one is also with and without minor children.

7. Environmental accounts

7.1 Introduction

In the national accounts, it is a matter of principle that the value of a product or merit payment corresponds with what has been paid or received for it in reality. In this way receipts and outlays always equal each other, which guarantees the consistency of the complete system. This valuation principle reveals market preferences for private products and the democratic preferences for public services. The registration of environmental pollution in the national accounts is in accordance with this principle. If environmental damage is not actually charged to the polluter, it should not have any influence on national income. After all, these social burdens are not deducted from the compensation of employees and stock-owners in these establishments and in addition household consumption will not have decreased. Similarly, a free use of certain environmental functions - like swimming in a clean sea - will not lead to an increase in national income.

Although the national accounts core system might contribute to the understanding of the development of a welfare society, it does not draw up a complete picture of the actual situation. Besides the unpaid consumption of environmental functions, the national accounts do not give any insight in for instance unpaid household work and leisure time. On the other hand, such aspects of welfare as national income, employment and social security benefits can be derived from the system of national accounts. However, they are not combined in some kind of adjusted national income. Non-monetary aspects of welfare can be embedded in a comprehensive information system from which for every aspect an individual indicator can be drawn.

In the environmental accounts the national accounts are linked to the environmental statistics. The environmental accounts show the connection between macro indicators for the economy (GDP, general savings, balance of payments, etc.) and the environment. The environmental accounts are a satellite account of the national accounts. The Dutch environmental accounts are compiled according to the guidelines of the international System of Integrated Environmental and Economic Accounting (SEEA 2003). Accordingly, the data from the environmental accounts are internationally comparable.

The major advantage of the environmental accounts is the direct link that can be established between the economic data of the national accounts and the environmental data. The environmental accounts can be used for all kinds of policy analyses. As an example, indirect economic and environmental effects of consumption or export of certain products can be demonstrated. The environmental accounts can also be used as a framework in an applied general equilibrium model. As such, the framework can be used to calculate the consequences of for instance energy levies on environmental themes (like greenhouse effect) and economic indicators (such as domestic product and national income). Another possible application of macro economic models is the estimation of a national income in a sustainable situation in which domestic product has been maximised, where at the same time a number of technical and economical constraints are satisfied and (on top of that) on the restriction that the pollution does not exceed certain targets.

The environmental accounts are compiled according to the definitions of the national accounts. Not only pollution caused by producers and consumers is shown, but also the entry of polluting substances in the Dutch environment: the domestically emitted pollution including the balance of cross-border pollution from and to the rest of the world. Cross-border pollution exists of two different parts:

- a. pollution by non-residents in the Netherlands or by residents abroad.
- b. supply and removal of pollution by surface water or air.

Because of the differences in concepts, the data of the environmental accounts can differ from other environmental energy statistics, as for example published in the Dutch Environmental Compendium and the Dutch energy balances.

7.2 Integrated environmental accounts

The physical environmental accounts (table NE 1) consist of two parts, namely an origin and a destination table that are shown underneath each other. In the upper part of the account the origin of the pollutants is registered. The pollution may originate from producers, households and abroad. The category other domestic origin consists of emissions from landfills or a transport difference. In the lower part of the accounts the destination of the pollutants is registered. Part of the pollution may end up abroad. Of the pollution that stays behind in the Netherlands the part that is reabsorbed in the production process is shown separately (absorption by producers). The remaining part of the pollution is regrouped according to the different environmental themes.

The concept of the themes has been adopted from the (second) Netherlands' 'National Environmental Policy Plan' where they are used as an integrating framework of current environmental problems in the Netherlands. In this account for every substance its contribution to the environmental themes is shown. These data are converted into so-called theme-equivalents. The weights reflect for each theme the potential relative stress of each substance on the environmental theme under consideration. This method has been developed by the Department of Housing, Regional Development and the Environment and is largely based on international research on the effects of different substances on the quality of the environment. In table NE 1 the following environmental themes are presented:

- *Greenhouse gas effect*: the emission of carbon dioxide (CO₂), methane (CH₄), laughing gas (N₂O) and the other greenhouse gasses (HFK's, PFK's and SF₆) to air, converted to greenhouse gas equivalents.
- *Ozone layer depletion*: the emission of CFK's and halons to air, converted to equivalents.
- *Acidification*: the emission of NO_x, SO₂ and NH₃ to air, converted to acidification equivalents.
- *Air pollution*: the emission of fine dust (PM10) to air in mln kg.
- *Eutrophication*: the emission of phosphorus and nitrogen to the environment, both the total (to air, soil and surface water) as to the surface water, converted to eutrophication equivalents.
- *Water pollution*: the emission of heavy metals (arsenic, mercury, chromium, copper, lead en zinc) to water, converted to heavy metal equivalents, and the discharge of waste water, converted in inhabitant equivalents.
- *Waste*: the production of solid waste (dangerous and non-dangerous) in mln kg.

This method yields only a limited number of physical environmental indicators. The indicators for the greenhouse effect and the depletion of the ozone layer monitor the Netherlands' contribution to these global themes. The other themes can be seen as national or regional themes, where the environmental damage within the country is at stake. For these themes, domestic pollution is augmented with the imports, and reduced by the exports of pollutants.

In the monetary environmental accounts (table NE 2) economic variables from the national accounts are presented (total production, value added and labour input) and a number of environmental related monetary variables like environmental expenditure and environmental taxes. Environmental costs are all annual costs related with activities to protect, restore or improve the environment. For the environmental taxes a distinction is

made between green taxes and environmental fees. Green taxes are taxes that intend to decrease activities harmful to the environment by increasing the price. The proceeds of these taxes go to the general funds and are not specifically used to finance environmental measures. Examples of green taxes are excises on motor fuels, the road tax, the tax on cars and motor vehicles and the energy tax. Environmental fees have been established to finance specific environmental measures that are conducted by the government, like the fee for the cleaning of waste water and fee for the treatment of household waste.

7.3 Physical and monetary supply and use tables

In the national accounts supply and use tables are used to give an overview of the supply and use of goods and services. Supply and use tables can also be used to show the physical flows that occur within the economy.

In tables NE 3 and NE 4 the physical and monetary supply and use tables for energy and water are presented. The data for energy are derived from the energy accounts, which are part of the environmental accounts. According to the definitions of the national accounts all physical energy flows are given for which there is a complementary monetary flow. This means that the total of the column in the physical accounts do not represent the total net energy consumption, as energy products are converted into one an-

other, which causes double counting. For example, crude oil is imported and subsequently transformed by the refineries into all kinds of oil products like petrol, diesel and fuel oil. For tap water only monetary values are available at this moment.

The physical and monetary supply table describe the supply of energy and tap water. A distinction is made between domestic production by industry and imports. The monetary values are given in basic prices.

The physical and monetary use table describe the use of energy and tap water. A distinction is made between intermediate consumption by producers, final use by households and exports. The monetary values are given in market prices (exclusive of value added tax).

7.4 Emissions to air of some pollutants

In table NE 5 is shown how the air pollution caused by Dutch residents (environmental accounts) is related to the air pollution produced on the Dutch national territory. The two points of differences, namely emissions by non-residents in the Netherlands and emissions by Dutch residents abroad are broken down by transport by road, air and water.

8. Labour

8.1 Introduction

In recent decades the statistical observation of the labour market regarding persons, administrations of enterprises as well as central registrations has been expanded regularly. Therefore more information has become available on the different aspects and areas of the labour market. In order to provide a coherent and consistent overview Statistics Netherlands has set up an integrated system of data on labour, called labour accounts. The data refer to uniformly delineated populations according to uniform classifications and are based on clear definitions and the identity relationships these bring about. The data are generated in a statistical integration process that leads to the most accurate estimates possible on the basis of the available information.

Both the national accounts and the labour accounts have been revised in 2005 for the reporting year 2001. In this revision the Social statistical database (SSB) has been used as a primary source for the estimation of the number of employed persons, the number of jobs of employed persons, the compensation of employees and the labour input of employees and self-employed persons. The SSB includes information about all persons, jobs and benefits in the Netherlands. In the SSB a great number of registers has been combined and made consistent on a micro level.

The information provided in the 'Labour' section comprises several aspects of the labour market. However, the tables only represent a small part of the data produced by the labour accounts. More detailed data are available through StatLine, the statistical database of Statistics Netherlands (<http://www.cbs.nl>).

8.2 Labour force

Employed labour force

The employed labour force consists of persons in the age category 15-64, who live in the Netherlands and work at least 12 hours a week. (This definition deviates from the ILO definition.)

Unemployed labour force

The unemployed labour force consists persons in the age category 15-64, who are looking for work for at least 12 hours a week, are immediately available and are currently without a job or work less than 12 hours a week. Looking for work means that in the preceding four weeks they have actively been seeking for a paid job. (This definition deviates from the ILO definition.)

8.3 Employed persons

Employed persons are all persons who are working for a business unit or private household residing in the Netherlands.

Employed persons include all persons who:

- have a paid job for at least one hour a week.
- perform a job of which the payment is withheld from registration of tax and/or social insurance authorities, while the work itself is legal.
- are temporarily not working (due to illness, bad weather, etc.), but who continue to receive their remuneration.
- have taken a temporarily unpaid leave.

Employed persons may either be employees or self-employed.

Employees / self-employed persons

Employees are persons who during a reference period performed some work for wage or salary, in cash or in kind.

Self-employed persons are those earn their income by performing labour on their own (company, profession) or who cooperate in the business of their family. The latter are not counted as self-employed if there is an employment contract.

8.4 Jobs

A job is a job opportunity occupied by an employed person. The number of jobs in a year is an average. When a job is only filled for part of the year it is only counted for that part. Because employed persons may hold more than one job, the number of jobs is higher than the number of employed persons.

Terms of employment: full-time job / part-time job

A full-time job concerns a full day or week task. All other jobs are part-time jobs.

Type of contract: fixed job / flexible job

Flexible jobs are jobs occupied by employees who work for employment agencies, work by request (stand-by worker) or have other jobs with irregular shifts. The number of flexible jobs in a year reflects the average number of job opportunities occupied by 'flexible' employees. All other jobs are fixed jobs.

Main job / secondary job

If a person holds more than one job, the main job is the job on which most hours are spent. Any other job is a second or third job.

8.5 Measure of labour input

Labour input may be expressed in jobs, full-time equivalent jobs and hours of work.

Full-time equivalent job

Labour input in full-time equivalent jobs is calculated by expressing all jobs (be it full-time, part-time or flexible) to full-time equivalents. The full-time equivalent is obtained by dividing the annual contractual hours of the job by the annual contractual hours considered full-time (in the same branch of industry). Two half-time jobs thus add up to one full-time equivalent.

For self-employed the full-time equivalent is the quotient of the usual weekly work hours of that job and the average weekly work hours of self-employed with 37 or more normal weekly hours (in the same branch of industry).

Hours of work

The labour input of employees is the total hours of work in the reference period. In the labour accounts several concepts of work hours are used: contractual hours, paid overtime, hours paid and hours actually worked.

Contractual hours

Contractual hours are the hours agreed in the contract between employer and employee. Agreed paid annual leave and paid public holidays are not included in the hours.

Paid overtime

Time worked in addition to normal hours of work for which a premium rate is paid. Returned overtime, time spent travelling and waiting time are not considered paid overtime.

Hours paid

Hours paid is the sum of contractual hours and paid overtime. Time spent on sick leave or bad weather leave belong to hours paid. Contrary to the legal terms, paid annual leave and public holidays are not considered part of hours paid. Payment over these days is allocated to the other days.

Hours actually worked

Hours actually worked are hours paid increased with unpaid overtime and decreased with hours paid, but not worked such as sickness absence, pregnancy leave, maternity leave, strikes, parental

leave, short-time absence and additional free time for older people.

8.6 Further details

The number of persons employed, jobs and labour inputs are classified according to economic activity and sex. The industrial classification is the Dutch 1993 Standard Industrial Classification (SBI 1993; according to the NACE Rev.1 classification) according to the enterprise where the employed person is on the payroll. So people working for temporary employment agencies are classified under temporary employment agencies, etc.

8.7 Payment of employees

Labour costs reflect the employers' expenses directly related to the use of individual employees in the production process. The labour costs concept in the labour accounts is identical to the national accounts and the ESA 1995 concept 'compensation of employees'. The labour costs concept contains two main components: remuneration and employers' social contributions.

Wages are the remunerations an employee receives in return for his or her employment. The most important form of wages is wages in cash (including withheld taxes on wages and contributions). Wages in cash are composed of regular gross wages, standard extra allowances (e.g. for hazardous work), bonuses, overtime pay, tips and compensation for costs related to employment (e.g. refunds of fares to and from work). Bonuses include holiday pay, *tantième*, gratifications, profit shares and a thirteenth or fourteenth month. Wages in kind occur if an employee benefits from his or her job besides being paid wages. Examples of payment in kind are private use of a company car, free housing, free food, lower interest rates on mortgages, free or cheap use of the company's products or services, and company supplied or subsidised day nursery.

Employers' social contributions consist of legally or contractually implied payments to social security, such as pension premiums. As set out by the ESA 1995, pay over periods in which no work is done due to illness or bad weather is also regarded as a social contribution.

9. Some breaks in the time series

9.1 Introduction

Data in the national accounts are estimated in such a way that they are comparable with data for contiguous years, thus reflecting year to year changes as accurately as possible.

Only at periodic revisions levels are updated and newly computed. Data for previous years are also adjusted then in order to retain comparability in time. In spite of aiming at comparability in time, discontinuities sometimes occur, mostly as a result of revisions, which are not fully calculated back in time. This results in a number of breaks in the tables in the chapter Historical data.

Besides changes in tax legislation, social security regulations, etc. may have a significant effect on the continuity of the time series.

9.2 Time series breaks caused by revisions

Statistics Netherlands has been compiling economic data since the 1930s. Later on, these data became part of the national accounts. 'Official' figures have been available since 1900. In due time the availability of new data sources, improved estimation techniques and new concepts have led to a number of national accounts revisions. In first instance, a revision is applied to one year for which simultaneously two data sets are compiled: one set according to the old methods and concepts and a second set according to the new ones. Subsequently, recalculations are carried out for a number of preceding years.

The number of years to be recomputed, however, differs for each revision. The long time series are therefore split into sub periods, which are not mutually comparable. In the time series, all figures in break years are given twice: before and after the revision concerned. For volume and price figures, the problem of break years can be avoided to some extent by presenting only changes relative to the preceding year and not indices related to a fixed base year.

In order to make possible long-term comparisons of volume and prices, table H 1 shows for a number of benchmark years indices based on 1938=100. They have been calculated by cumulating the annual mutations from previous tables.

For the estimation of the national income a number of different methods have been applied. The first one is the income method. The incomes of individual units are aggregated to a national total. These incomes are mainly based on fiscal data. The second is the net-production method. Here for every individual industry its production and its intermediate consumption are determined through production data, based on industrial surveys. The difference between production and intermediate consumption is the value added. The national income is the sum of the value added of all industries, after an adjustment for primary income transactions with the rest of the world. The third method is the commodity-flow or input-output method. This method too is based on estimates of production and intermediate consumption; however in this case production and intermediate consumption by industry are detailed in goods and services groups. For each and every goods and service group should hold that the production of an industry should be supplied to either the other industries or to final expenditure categories. The other way around the intermediate consumption by each industry of each group of goods and services should originate from the production by a domestic industry, imports or the decrease of inventories. These identities between 'available' and 'used' opens the possibility to make detailed confrontations and to determine for each industry its production, intermediate consumption and value added in such a way that the results are consistent with those for other industries. Of all the methods mentioned above the commodity-flow method is the most reliable.

For 1900-1920 only national income data have been calculated, applying the income method. Volume data were obtained by deflating with a consumer price index for working-class families. The concepts used then deviate from those currently in use. For details we refer to the publication 'Berekeningen over het nationale inkomen van Nederland voor de periode 1900-1920' (Speciale Onderzoekingen van de Nederlandsche Conjunctuur, No. 4, 1941).

Some time ago data for the period 1921-1939 have been revised, as much as possible in accordance with the concepts currently in use. Here the net-production method has been applied. Several variables, like expenditure categories have been estimated autonomously. Deflators are calculated on the basis of detailed data. Details can be found in the publication 'The Dutch economy, 1921-1939 and 1969-1985. A comparison based on revised macro-economic data for the interwar period'.

For the years 1940-1945 the same method has been applied as for 1900-1920. The data and methods have been published in 'Statistische en econometrische onderzoekingen', nieuwe reeks, jaargang 5, 1^e kwartaal 1950. For 1940-1945 only national income (net, factor costs) data are available (see the publication National accounts of the Netherlands 1999). The volume data too concerns the concept of factor costs. For the sake of continuity this concept has also been upheld for 1946-1948. For 1946 and 1947 the commodity-flow method has been applied. At several points the concepts used deviate from the modern ones. Besides that, later revisions have not been calculated backwards. For more details we refer to the publication 'De Nationale Jaarrekeningen: doeleinden, problemen, resultaten' (Monografieën van de Nederlandse Conjunctuur, no. 8, 1950).

For the years after 1948 the commodity-flow method has been applied. The original data for the period 1948-1957 have been published in 'Statistische en Econometrische Onderzoekingen', 2^e en 3^e kwartaal 1958, those for 1958 and after have been published in the annual publications of the national accounts.

The data for the years from 1948 onwards have been revised several times. The first revision concerned the year 1977 and was calculated backwards no further than to 1969. This revision is described in the publications 'Nationale rekeningen 1980' and 'Nationale rekeningen 1969-1981 met herziene reeksen voor de jaren 1969-1976'.

In 1992 a revision was carried out for the benchmark year 1987; see 'Nationale rekeningen 1991, volume II'. The 1987 revision was calculated backwards until 1969, the figures are given in the publications 'Nationale rekeningen – gereviseerde reeksen 1977-1986' and 'Nationale rekeningen – gereviseerde reeksen 1969-1976'.

Revised data for the years 1995-1998 were presented in the National accounts 1998. Since then the Dutch national accounts are in accordance with the newest international guidelines: the European System of Accounts (ESA 1995) and the System of National Accounts (SNA 1993). A detailed description of the 1995 revision is presented in the publication 'Revision Dutch National Accounts: first results and backgrounds'. This revision has now been calculated backwards until 1969.

In 2005 a revision has been carried out for the reporting year 2001. A detailed description of this revision is given in the publication 'Nationale rekeningen 2004, Revisie 2001 – Beschrijving en uitkomsten revisiejaar 2001' (Dutch edition). The figures for the years after 2001 have been revised as well. Expectations are that in spring 2007 the revision will be calculated backwards until 1969.

9.3 Effects of recent government measures

A number of changes, introduced recently in the field of taxes and social security have had important effects on the continuity of national accounts data. A few important changes are mentioned below.

Operation social housing

In 1995, the government redeemed specific long-term liabilities towards housing corporations. The redemption sum was based on the present value of liabilities and amounted up to 14,9 billion euro. In the national accounts, this is recorded as a capital transfer from the government through non-financial corporations. In 1995, this led to a sharp increase in net borrowing of the government while at the same time net lending of non-financial corporations rose to the same extent. Housing corporations used the redemption money for early repayment of all housing loans to the government. As a result rent subsidies decreased sharply in 1995.

Restitution of excise duties on wine

In 1996 because of a finding of the European Court of Justice, the government had to pay back 204,2 million euro to the wine branch. The exempt from excise duties on fruit wines (till 1992) appeared to be applicable to table wines too.

Financing old people's homes

Starting in 1997 the financing of the services of old people's homes is covered by the Exceptional Medical Health Act (AWBZ). Until that year the financing took place through the general means of the government and own contributions of households. Due to this measure the social assistance benefits in kind decreased

while the social security contributions and the social security benefits increased with 1,4 billion euro. The increase of the contributions is compensated by a decrease of the wage tax.

The introduction of the PEMBA

In 1998 the PEMBA was introduced. This is a Dutch acronym for Premium differentiation and the market effect on disablement insurance. The underlying idea of the PEMBA operation is to lay down the risks at the employers, because these were supposed to prevent disablement. The PEMBA operation consists of three measures.

Firstly, the scope has been adapted to that part of the disablement, which is covered by social security, to fit better with different kinds of risks. For this reason the Fund for Disabled Civil Servants (FAOP) and the employee's part of the General Disablement Benefits Act (AAW) were merged with the Disablement Insurance Act (WAO). In contrast the benefits to young disabled persons are no longer covered by the social security contributions (AAW), but through the general funds (WAJONG). Young disabled persons are defined as people who are borne with a handicap and so will never be able to earn income.

Secondly, from now on the disablement contributions are fully covered by the employers. The employers in their turn are compensated by a drastically decrease in their transfer surcharge.

Thirdly, part of the employer's contributions has been made variable, that are the contributions for the Disablement Insurance Fund (AOK). These are from now on dependent on the number of employees that became disabled. So in case few employees become disabled, the employer pays less. This is a way to stimulate the employer to prevent employees to become disabled.

10. Price and volume changes

10.1 Introduction

One of the most important figures of the national accounts is the volume growth of gross domestic product (GDP). But volume changes of many other national accounts' transactions like consumption and fixed capital formation play an important role in many fields also.

Determining changes in volume is difficult. Several theoretical and practical problems play a role. In this explanation these will be discussed. Furthermore is discussed, which improvements in methods have been and will be carried through.

First some aspects of determining price and volume measures will be discussed in paragraph 10.2. Subsequently, paragraph 10.3 focuses on changes in volume of value added and its components. The main sources are noted in paragraph 10.4. The Eurostat handbook on price and volume measures is subject of paragraph 10.5. The current and coming improvements in estimates will be discussed in paragraph 10.6 to 10.9.

10.2 Some questions at estimates in constant prices

Supply and use tables

Supply and use tables play an important role in determining price and volume changes. In supply and use tables, supply and use of commodities, specified for each commodity, is described. From 1987 on these tables are used as an integration framework.

Supply and use tables make, contrary to input-output tables, optimal use of available sources since production statistics, foreign trade statistics, data on consumption and capital formation all contain information on products. The introduction of supply and use tables has highly improved the quality of the estimates.

Simultaneously composing and balancing supply and use tables in current and constant prices.

Up to the beginning of the eighties balancing of national accounts was performed in current prices after which separate volume changes were computed. From the 1987 revision onwards supply and use tables are composed both in current prices and prices of the preceding year (constant prices).

A major advantage of estimating price and volume changes in an integration framework such as the supply and use tables is that it allows checking the plausibility and consistency of the set as a whole. Another advantage is that price and volume changes can be determined for the main balancing items in the national accounts. In this way gross value added in constant prices is determined as the difference of production in constant prices and intermediary consumption in constant prices. This is called 'the double deflation' method.

The choice of the index number formulae

Part of the design of the system is the choice of index formulae to be used in the integration framework. From a practical point of view, two requirements should be imposed on the index number formulae to be used in compiling constant price data:

- additive consistency.
- value index equals the product of price index and volume index.

In an accounting framework like the supply and use table, additivity simplifies the balancing of the system. Additivity means that parts of an aggregate in the supply and use table sum up to a total amount of that aggregate. Besides, all consistency checks, which are valid in current prices, hold also at constant prices.

The second requirement means that the value index is split up into a volume part and price part without remainder. The international guidelines for national accounts favour Fisher's index, because of its close approximation of the theoretical superlative index formulae like the Tornqvist and Vartia. Disadvantage of the Fisher formula is that it is relying on data availability, and that the results are not easy to be interpreted. Last but not least using this index formula means that there is no additive consistency. This means that the Fisher index is not easily applicable in an accounting framework where additivity is an important issue. A way out is the use of a combination of Paasche price indices and Laspeyres volume indices. This combination of indices provides an acceptable alternative and fulfils the requirements mentioned above.

The choice of the base year

Another issue in constant price estimation is the choice of the base year. Both the SNA 1993 and the ESA 1995 favour the use of a moving base year. In practice, this means that for each reporting year, the preceding year will be the base year. Advantages are:

- an up-to-date weighting scheme provides better estimates of growth rates.
- no burdensome rebasing of time series.

Applying several types of index number formulae, using the detailed supply and use data of the Netherlands, reveals that Paasche and Laspeyres chain volume indices in general provide a close approximation of Fisher's Ideal Index.

Non-additivity

A disadvantage when using chain indices to construct time series of values in constant prices of a certain base year is that the deflated parts of an aggregate do not add up to the deflated aggregate itself. The magnitude of this "mathematical discrepancy" varies with the way the aggregate is split up into different sub groups.

In the Dutch National accounts publication, the mathematical discrepancies in constant price tables are not eliminated, but these tables are left non-additive. Constant price tables are not presented separately, but always in conjunction with other tables. In this presentation a fixed sequence is held: current prices, volume changes, chain volume indices and values at constant prices (by applying these volume indices). Price changes and chain indices of deflators are given as well.

Quality changes

Changes in values resulting from changes of quality should be excluded from the price index and be included into the volume index. The volume index is the product of the quantity index and the quality index. Quality changes can occur in two ways: changes in the product mix and changes in the (physical) characteristics of products. The requirement of a proper measurement of quality change from changes in the product mix is fulfilled to a higher degree when transactions are more homogeneous. The number of product groups in the Dutch supply and use table (800) is considerable. From this point of view, quality changes are measured reasonably well.

For measuring quality changes of individual products, it is necessary that changes in the value per unit are corrected for changes in the (physical) characteristics of goods and services in price statistics. Generally speaking, the Dutch price statistics for production, international trade and private consumption of households are not considerably biased by quality changes. These price statistics are the main source for the compilation of supply and use tables at constant prices.

10.3 Volume changes of value added and its components

As mentioned above, supply and use tables are also set up in constant prices. This means that for all transactions in the supply and use tables volume changes can be determined.

The determination of the volume growth of value added in supply and use tables deserves some special attention. As well as for current prices as for constant prices, value added is determined by subtracting intermediate consumption from production value for each industry. Besides this approach of GDP by use of output value, GDP can also be derived from final use. The sum of consumption, capital formation, exports minus imports should match the sum of value added. This counts for both current and constant prices. As a result measurement of volume change of GDP on the base of value added equals by definition volume change of GDP on the base of final expenditure. Both approaches are recorded in one and the same system of supply and use tables.

The estimating procedure applied for value added in constant prices depends on the type of production. Production of commodities can be classified into market and non-market production. Above all, for non-market output it is relevant to distinguish between individual goods and services and collective services.

Value added of industries producing market output

Value added in current prices by industry is estimated as the difference between gross output and intermediate consumption of goods and services at current prices. Value added in constant prices by industry is estimated as the difference between gross output in constant prices and intermediate consumption of goods and services in constant prices.

Value added of industries mainly producing non-market individual goods and services

In the case of industries mainly producing non-market individual goods and services, there is a difference in the way current price estimates of value added and constant price estimates of value added are determined. Subsidized education is an example of non-market production of individual services.

Output in current prices is estimated as the sum of total intermediate consumption, labour costs, other taxes and subsidies on production and consumption of fixed capital. As a result, value added at current prices equals the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital.

Output in constant prices of an industry mainly producing non-market individual goods and services is estimated by multiplying output in the previous year by the volume index of output.

Total value added in constant prices is estimated as the difference between deflated gross output and deflated intermediate consumption of goods and services.

In the Netherlands for the majority of the production of non-market individual goods and services volume indicators are available. The main example is educational services.

In other cases for purposes of compiling price and volume changes the same method is used as for collective services.

Value added of industries mainly producing collective services

In the case of industries mainly producing collective services there is a resemblance in the way current and constant price estimates of value added are determined. Public administration is an example of non-market production of collective services.

Output in current prices is estimated as the sum of total intermediate consumption, labour costs, other taxes and subsidies on production and consumption of fixed capital. As a result, value added at current prices equals the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital.

No appropriate quantity indicators are available for the estimate of the volume change of the output of collective services. Therefore, as an approximation, output of an industry producing collective services in constant prices is calculated as the sum of total intermediate consumption, labour costs, other taxes and subsidies on production and consumption of fixed capital in constant prices. As a result, value added at constant prices equals the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital in constant prices.

In the Dutch national accounts the estimate of the consumption of fixed capital in constant prices is an implicit part of the estimate in current prices. Implicit deflators are the price indices of the domestic purchases per capital commodity, which are derived as the weighted average of the producer price indices of domestic sales and imports.

Compensation of employees

Compensation of employees is part of total value added. It is useful to estimate compensation of employees in constant prices, as it increases the possibilities for economic analysis based on supply and use tables. Among others, the results can be used in the analysis of labour productivity.

Compensation of employees consists of two parts, wages and salaries, both in cash and in kind, and employers' social contributions.

In the calculation of wages and salaries in cash in constant prices a price approach is applied: price changes of the *total* amount of labour input are observed and volume changes are derived. Quality changes in labour are not accounted for.

The volume index of employers' social contributions should equal to the volume index of wages and salaries. As a result of this, the price index can be derived from the value index and the volume index.

In the estimation of wages and salaries in kind, recorded at constant prices it is assumed that the volume index of wages and salaries in kind equals the volume index of wages and salaries in cash.

Taxes and subsidies on products

Taxes and subsidies on products affect the *price* of a product, not its *volume*. Accordingly, for the compilation of price and volume changes it is a requirement that the resulting volume index of goods or services is the same both including and excluding taxes. This means that the volume index of the taxes on a transaction is the same as the volume index of the transaction including (or excluding) taxes.

For an accurate estimation of the volume index of a tax or a subsidy, special attention is paid to the question which part of the supply or use of a commodity is taxed or subsidised. For instance, a tax is levied only on the domestic consumption of a product and not on exports.

Other taxes and subsidies on production

In the compilation of price and volume changes of other taxes and subsidies on production volume indicators are used in many cases.

10.4 Main sources used

The main sources that are used in the determination of price and volume changes of national accounts figures are producer price indices and consumer price indices. Besides these sources several other sources are used.

Producer price indices

A considerable part of the price index numbers used for the compilation of price and volume changes of commodities in the Dutch

national accounts is derived from the producer price statistics. In an increasing way producer price indices are used for determining volume changes of services.

The producer prices statistics provide price indices for sales, intermediate consumption, foreign trade; divided by product and activity. Until some years ago the coverage of statistics was almost completely limited to products of producers who had their main activity in mining, industry, production and distribution of electricity, gas and water. Recently, for some categories of business services, producer price indices have been developed. It is expected that this number will further increase in the coming years.

Consumer price indices

Consumer price index numbers are used for the compilation of price and volume changes of consumption of households. They are also applied as approximate deflators for output or for intermediate consumption in case producer price indices are lacking.

The published consumer price indices present the average price change of the goods and services bought by the average Dutch private households in the base year. For the purposes of compiling price and volume changes in the national accounts the consumer price indices are applied at least at the detailed 800 commodity level of the supply and use tables.

Other sources

Other data used in the compilation of price and volume changes of the national accounts are: quantity indicators, unit-value indices, price and quantity data from agriculture related agencies and annual reports of enterprises and institutions. For the other part data are requested for from social institutions such as the Chamber of Commerce, the Dutch cycling union, the consumer union and sport institutions like NOC-NSF.

For some specific products (services of banks, insurance services, education, passenger transport by train etc.) no proper price indices are available for the compilation of price and volume changes of output, but there are (nearly) integral and detailed data on quantities available.

For instance, the number of passenger kilometres is used as an indicator for passenger transportation. As a direct result of this, different indicators for different commodities have been developed.

In compiling price and volume changes of insurance and pension funding services quantity indicators are used for each part of the set of insurance services. Examples are the numbers of current and new insurance policies.

For educational services it is difficult to obtain suitable price indices, as the nature of the service (the transfer of knowledge) is very diverse and specific. Differences of quality are hard to transform into a suitable volume-indicator. Most methods used for measurement of production of educational services can be categorised as A and B methods.

The number of pupils is used as indicator for the production of primary education, special education and vocational education. The number of pupils moving up is used as quantity indicator for lower and higher general secondary education and pre-university education. For vocational colleges the quantity indicator is the number of pupils as well, but adjusted for the expected duration of the study before certification. For tertiary education an input method is used for the time being.

To measure qualities and quantities of health care of consumers in real terms, for each subgroup, a specific indicator is used. To the product group health care special attention is drawn, as it takes care of a main part of the realization of gross domestic product.

Until recently, the price and volume changes of the production of hospital services (including medical specialists) were determined using seven quantity indicators. The weightings of these indicators were based on care expenses of Medical Health Fund. Because

this method didn't apply to the requirements of the handbook, a new method has been introduced.

Other care services comprise a heterogeneous set of services of which the value in constant prices is determined in different ways. In a number of cases tariff information is used (for example services of general practitioners, dentists or midwives) or consumer price indices (for example patient transportation). These methods comply with the handbook. In some cases no price information is available and input methods which are not permitted are used. This is among others the case with blood banks, ambulance services and alternative health care.

Unit-value indices are used for deflation in some specific cases where values and quantities are available for transactions of homogeneous products (especially bulk goods). Examples are the exports and imports of certain agricultural products. Another example is the output of certain transport services where, besides the value of production, data on ton kilometres are available. More often, unit-value indices are used to check the plausibility of other price indicators like the producer price indices of exports and imports.

Especially for specific agricultural products, the value of output is derived from the combination of price and quantity data at a low level of aggregation. The price data are often provided by semi-governmental agencies related to the agricultural sector like the 'Landbouw Economisch Instituut' (Agricultural Economic Institute) and the 'Productschappen' (Commodity boards) for horticulture, dairy products, eggs, etc.

Balancing

Even though the balancing process is not a real "source" of price and quantity indicators, it plays an important role in the quality of the estimates. In the first place for checks of consistency for instance between producer and consumer price indices. More in general value-, price- and volume-indices are checked during the simultaneous balancing of current and constant price values.

10.5 The handbook on price and volume measures in national accounts

In international guidelines for national accounts, such as the System of National Accounts 1993 (SNA 1993) and the European system of accounts 1995 (ESA 1995) relatively little attention is being drawn on price and volume measures.

With the occurrence of the Growth and stability pact the demand for qualitatively good and international comparable price and volume data has increased. This has led to the publication of the Handbook on price and volume measures by the European Union (Eurostat) in 2001. This book gives a complete survey of topics on price and volume measurement. Besides general principles, specific rules are drawn for determining price and volume changes for separate commodities. The handbook is an extension of and consistent with the ESA 1995. The use of the prescribed price and volume methods has been ratified by a European regulation.

The Eurostat handbook prescribes which methods should be used for the determination of volume development of different commodity groups. In accordance with international guidelines, Statistics Netherlands has focussed on developing new and better methods for price and volume measurement. Particularly for measuring services in constant prices this is of increasing relevance as services fulfil a growing part of GDP in The Netherlands. In the handbook different qualifications are attributed to price and volume methods. With that, A, B and C methods can be distinguished.

So called A methods are methods that meet all requirements. These methods measure the volume development of output including improvements in quality of commodities. An indicator that qualifies for A method should guarantee a specific and complete coverage. Furthermore an A method should comply with national accounts concepts.

A method is a B method if it's an acceptable approach of an A method. An example of a B method is a method that satisfies the demand of representativeness in a reasonable way but does not take account for quality developments.

C methods are methods that can not be qualified as A or B method. Examples of C methods are input methods or methods that are not representative. An input method equals volume and price development of output to the development of (the sum of) inputs. In fact constant productivity is assumed. C methods are not allowed under European law from 2006.

In 2003 an inventory of methods used was made for the statistical year 1999. It was concluded that for several commodities with a relatively large share in GDP better accounting methods should be developed.

Besides regulations that stem from the Handbook on price and volume measures in national accounts, several motives for the introduction of new accounting methods existed. First of all, certain developments in society made that indices used did not cover production value anymore. Also the moment of availability of relevant information restricts the quality of price and volume measurement. The continuous aim to develop new methods by Statistics Netherlands has led to the introduction of new methods as well.

10.6 Realised improvements

Several improvements in methods for price and volume measurement have been carried through. Examples are: postal and telecommunication services, real estate activities, hospital care, parts of business services (legal services, accountancy), employers and employees organisations, professional and idealistic organisations and banking services. Newly developed methods for these services are discussed below. It should be noted that it concerns final year estimates in general.

Postal and telecommunication services

For postal services Statistics Netherlands used data from the annual reports in the past. Quantitative data served as source for the volume-estimates. Recently, a producer price index for postal services has been developed, which has been introduced in the national accounts in 2004. Using this producer price index, volume growth of postal and telecommunications services can be measured more accurately.

Fixed and mobile telecommunication services are split into a producer and consumer part which are deflated separately in national accounts. For deflation of the producer part a producer price index is used and for deflation of the consumer part a consumer price index is used. Both methods are A methods. For cable and internet services a consumer price index is applied. These newly developed methods are adopted for the first time in 2004.

Real estate activities

Using the old method, production value of these services was deflated by a price index based on information of price developments on the office building market from specialist's journals. Qualitative better indicators have been developed for real estate activities since reporting year 2004. The newly developed price indicator has been composed on the base of price developments in the office-, store and working accommodation market. Both price developments of rented and newly rented objects are considered. Price developments in the office-, store and working accommodation market are weighted together and transformed into one price index for deflating production value. As these services are mainly used intermediary, the influence of the introduction of this method is little.

Hospital services

At the start of reporting year 2001 a new method for deflation of production of hospitals (including medical specialists) has been introduced into national accounts. This new method deflates hospital care with an overall quantitative indicator. The number of

care with an overall quantitative indicator. The number of patients discharged from day and clinical treatment is used as a quantitative indicator. To derive as homogeneous groups as possible, nearly 900 diagnoses groups and seven age categories are distinguished. The partially volume indicators are weighted and put together. The number of hospital days per diagnoses and age group are used as weights.

Business services

Business services comprise a heterogeneous cluster of services, under which services of accountants, bookkeepers, tax consultants, engineers, architects and administrators. In national accounts these services are mainly deflated by consumer price indices or collective labour agreement indices. However, these methods are often not representative or do not meet requirements that are prescribed in the handbook.

Lately, for several business services improved producer price indices have been developed. At this moment their employability in national accounts is being investigated. The producer price indices have been developed on the base of standard hourly rates and realised rates. Producer price indices on the base of realised hourly rates for accountancy and similar services were first published by Statistics Netherlands last year. Starting with the (provisional) reporting year 2005 a weighted average price index has been used in national accounts for the services concerned.

Services of trade unions, employers' organisations, professional and ideal institutions

For services of this type of organizations new volume indicators have been developed and employed in the national accounts starting with the reporting year 2003. For employers' and professional organisations the number of registered companies at 'Kamers van Koophandel' (the Chambers of commerce) has been used. For constant price calculation of the services of trade unions Statistics Netherlands uses a volume index of registered numbers of members. To determine the services rendered by ideal organisations in constant prices, different quantity indicators are used.

Provisions on banking services

For several types of provisions on banking services better suitable quantity indicators have been developed. In the past general indicators, for example a collective labour agreement fee index was used for deflation. Nowadays specific price and volume indices are used for each provision category. Newly developed methods suffice to a large extent to the requirements of a B method.

10.7 Improvements in the quality of service measurement of different product groups

The table below indicates the quality improvements that have been made for volume measurement of services since the reporting year 1999. The figures apply to methods used for final year estimations. Besides final year estimations, quarterly and provisional year estimates are drawn up. The development for those estimates can differ from final year estimates. For reporting year 2003 15% of production value is measured by an A method, whereas more than 60% of production value is provided with a B method. In reporting year 1999 31% of total production value was provided for an unacceptable C method.

Contribution in production value of A, B and C methods

Type of method	Share 1999	Share 2003
A	14%	15%
B	55%	60%
C	31%	25%

The improvements described above all relate to services. In general measuring the volume component of production value of services is faced with more difficulties than measuring the volume component of production value of goods. Therefore, the image for production of goods is more favourable than the image described

above for services. According to the inventory of 2003, 96% of methods used at agricultural and industrial production met the qualification of A or B method.

10.8 Trend break as a result of the use of new methods for different estimates

From the description above it can be concluded that a large number of new methods for the estimation of price- and volume mutations have been introduced into the national accounts. In this respect, the choice has been made to implement newly developed methods at the first opportunity. Volume growth data delivered in 2006 should be provided with at least a B method. It seems sensible, for the phase of this project, to continue this routine. This can lead to two types of breaks in national accounts statistics.

1. breaks within the subsequent volume estimates of a reporting year (sum of quarters, provisional, revised provision, final).
2. breaks in volume growth figures in time.

A number of actions will ensure that breaks will be visualized for national account users. In an introduction calendar will be indicated when a new method has been introduced and for which estimate of a reporting year this has happened. Where possible, by the use of (econometrical) research, the amount of breaks in subsequent estimates of a specific year will be quantified.

10.9 Future improvements

In future further improvements on estimates of price and volume changes will be carried through. At first it will concern construction, business services, education and health care.

Construction: construction of new buildings

To determine the production value of new buildings a new method has been developed. This method accounts for great diversity of production. Besides offices and factories, sheds, stores and schools cover new buildings. Furthermore building circumstances (for example underground) are different and important to identify. Based on information of construction licenses, a price index that corrects for these differences is compiled. This method will be used in national accounts coming years.

Business services

For the services of engineers a new producer price index has been developed recently. At this moment it is not in use yet for national accounts purposes. For advertising services a producer price index will replace the collective labour agreement fee index that has been used until now. This index will be completed by a volume-indicator on the base of minutes broadcasting time.

For computer services a producer price index has been developed but has not been taken into regularly production yet. This method is based on realised hour tariffs and will, when proved to be appropriate, be used for deflation of computer services in national accounts.

For other business services no representative price information is available yet. This has to do with the high degree of heterogeneity in this branch. Until now, an average price index based on price development of for instance the services of photography companies has been used. This year, a survey will be held to determine an appropriate price and volume method.

Education

For tertiary education an input method is used to measure volume developments at this moment. Next year it will be investigated whether a more appropriate method can be developed.

Health care

For a number of care services, the development of new methods will be investigated next year, because the input methods presently used do not meet the requirements of the handbook. The services concerned are: alternative healers, services of blood banks, psychologists and ambulance services. Furthermore, for some parts of health care new methods will be developed, since new information will be available in the near future.

Annexes

1. The economic activities in the extensive supply, use and input-output tables

SBI 1993	Description	SBI 1993	Description

20	Machinery and equipment n.e.c. Machinery and equipment n.e.c. Repair services of machinery Arms and ammunition Domestic appliances	31	Repair of consumer goods (incl. motor vehicles) Repair services of passenger cars; bicycles and motorbikes Other repair services of consumer goods
21	Photocopiers, computers, office machinery and parts	32	Hotel and restaurant services Beverage serving services, cafés and the like Accommodation services; restaurant services
22	Electrical machinery n.e.c.	33	Transport services Railway transportation; travellers Railway transportation; goods Other passenger transport services Other services related to road transport, parking Pipelines Services related to sea-going transportation Services related to inland-water transportation; passengers Services related to inland-water transportation; goods Services related to air transport Other supporting services for air transport (airports) Travel agencies and tourist assistance services Supporting services for other transport enterprises
23	Radio, television and communication apparatus	34	Post and telecommunication services Postal and courier services Telecommunication services
24	Medical, precision and optical instruments Medical equipment Precision and optical instruments	35	Monetary intermediation services Bank services Imputed bank services
25	Motor vehicles Passenger cars Other motor vehicles, trailers and semi-trailers motor vehicles Parts for motor vehicles (excluding electrical)	*	Insurance and pension funding services
26	Other transport equipment Sea going ships Other ships (incl. repair and maintenance) Railways and tramway locomotives and rolling stock; repair and parts Airplanes Repair and maintenance services of aircraft Motorcycles and bicycles Invalid carriages and parts thereof Other transport equipment	*	Services auxiliary to financial intermediation
		36	Real estate services Real estate brokers; architects Letting services Leasing or rental services of non-residential buildings and land
		37	Renting services of movables

Row G 0.1 G 0.2	Description	Row G 0.1 G 0.2	Description
38	Business services Computer services Research and development services by scientific institutions Relief organisations Supply services of support personnel Miscellaneous business services	41	Health and social work services Health services Veterinary activities Social work services
39	Public administration, defence, social security Public services Mutual services of government Extraterritorial organisations	42	Services n.e.c. Sewage and refuse disposal services Services furnished by social organisations Motion pictures services; theatre companies and services provided by individual artists Cinema's Broadcasting corporations News agency services Library and museums' services and other cultural services Sports organisations; sportclubs Gambling and betting services Other recreational services Washing, dry cleaning and dyeing and colouring services; hairdressers and other beauty treatment services Other personal services Private households with employed personnel
40	Education Subsidized education Driving school services Other private education		

The supply and use tables (tables G 0.1 and G 0.2) are highly aggregated. This annex gives for each product group the underlying commodity groups for each of which information is available. The "*" marked product groups are already mentioned in the tables of the chapter Supply, production and final expenditure.

3. Papers and international publications

This annex contains three lists. They present a number of papers discussing fundamental theoretical or statistical issues related to national accounting, or on analyses based on national accounts figures.

The occasional papers (list A) are written in English. They are especially aimed at experts on national accounts. The papers are available as PDF-file on the website of Statistics Netherlands: <http://www.cbs.nl>.

A. Occasional papers

4. Additional data

This annex contains a list of available, but unpublished national accounts data. The statistics often provide data on a more detailed level than those contained in this publication. They should be interpreted with care. Those statistics denoted with an asterisk (*)

have a tentative character and cannot be published without express written consent of the Statistics Netherlands.

The data mentioned in the list will be supplied on request.

See the colophon in this publication for information on how and where to order.

Additional data

Subject	Kind of data	Period
Taxes on production and imports by type and industry	cup	1995-2005
Expenditure categories by tariff groups of VAT*	cup	2001-2003
Domestic product (gross, market prices) by sector and industry*	vi	1996-2005
Construction		
a. production by type and destination	cup, cop	1995-2005
b. production of repairs and maintenance by kind and destination	cup	1995-2005
Final consumption expenditure of households		
a. by type of goods and services (detailed table)*	cup	2001-2005
b. by type of goods and services (classification G 14)	cop	2002-2005
Detailed input-output table, distribution of output according to an alternative registration and some supplementary data	cup	1995-2005
Fixed capital formation, gross		
a. by type of capital good and industry (on an owner basis)	cup, cop	1995-2004
b. by type of capital good and industry (on a user basis)	cup	1995-2004
c. by type of capital good and industry of origin	cup, cop	1995-2004
Imports of goods and services separately, by industry*	cup	1995-2005
NAMEA, accounts and indicators for economy and environment	cup	1990-2005
General government		
a. deflators	pi	1995-2005
- 'personnel deflator'		
- 'non compensation deflator'		
b. output, intermediate consumption, taxes on production and imports, subsidies, compensation of employees, consumption of fixed capital and operating surplus by subsector	cup	1995-2005
Social security contributions and contributions to pension schemes of households, specified by employees, self-employed and others	cup	1995-2005
Primary income transactions and capital transactions by origin and destination	cup	1995-2005

Subject	Kind of data	Period
Social Accounting Matrix, integrated data framework based on national accounts extended with information on income, consumption and savings by household category	cup	2001-2005
Social security benefits by function and law	cup	1995-2005
Exports of goods and services separately, by industry in producers' prices and trade and transport margins*	cup	1995-2005

Those statistics with an (*) are not intended for publication without express consent of Statistics Netherlands.

Abbreviations:

cup = current prices
 cop = constant prices
 pi = deflators (indices)
 vi = volume indices
 vc = volume changes

5. International data

5.1 Introduction

National accounts data are published on paper in the publications 'Nationale rekeningen' in Dutch and 'National accounts of the Netherlands' in English and on the CBS-site (StatLine) on internet (<http://www.cbs.nl>).

National accounts data are used by a large number of institutions, for instance Eurostat (the statistical bureau of the European Union), OECD, UN, IMF, ECB (the European Central Bank) and ILO (International labour office).

The Netherlands are, due to international rules, obliged to furnish to international institutions clearly defined data at a certain point of time. The most important recipient is Eurostat; this institute redirects the data to the OECD, UN and the ECB. Eurostat also calculates the aggregates for the EU and the EMU (the Economic and Monetary Union). Here the itemised accounts can go further than the 'regular' publication scheme of the Dutch National accounts.

5.2 Eurostat

The rules of the EU commit the Netherlands to provide Eurostat with its National accounts data. This is a matter of legal obligation.

Council Regulation (EU) Nr. 2223/96, dated 25 June 1996 concerning the European System of National and Regional Accounts (ESA 1995) in the EU describes in detail which and when data must be provided to Eurostat. The regulation has been published in Nr. L310/1, 30 November 1996. In future the statistical obligations to Eurostat will be extended.

5.3 Administrative use of national accounts data

A large number of international treaties and international guidelines contain data from the national accounts. The international significance and the administrative application of national accounts data are on the increase all the time.

Both the VAT-contribution and the GNI-contribution of the Netherlands to the EU are based on the national accounts. On the revenue side the national accounts dominates the picture. The distribution of the GDP over the regions, which can be traced from the regional national accounts, partly determines the level of the contribution, which the Netherlands will receive from the European structural funds. In short, the net position of the Netherlands in relation to the EU will to a large extent be determined by national accounts data.

Because of the increasing importance of the GNI it has become that all European members exactly apply the same definitions for the statistical concepts. So that's why agreements have been made for mutually comparable harmonised figures.

Under the auspices of Eurostat a GNI manageable committee has been founded, which as its main task to guard the quality of the GNI estimates of the member states. The committee checks whether the regulations are observed. Checks are also made by the European Auditor's Office. The quality and international comparability of the national accounts had a favourable effect.

The government debt and the government deficit as a percentage of the GDP play an essential role for the entry to the EMU (Maastricht Treaty) and in the stability pact (Amsterdam Treaty). A fine due to the failure to comply with the obligations of the Treaty of Amsterdam and possible mitigating circumstances (economic depression) are related to the national accounts.

5.4 International classifications

The concepts and classifications of the national accounts have been worldwide standardised and are laid down in international guidelines (SNA 1993 and ESA 1995). This is of vital importance for international comparability.

In general the Dutch national accounts follow the international classification of ESA 1995. In a limited number of cases the classification has been adapted to the Dutch situation.

In the ESA 1995 the following classifications are distinguished:

Industries (NACE Rev.1).

Products (CPA).

Institutional sectors.

Transactions and accounts.

Individual consumption by purpose and functions of Government. Statistics Netherlands has its own classification, the Standard Classification of all (Dutch) Industrial Activities 1993 (SBI 1993). This classification is based on the European Nomenclature Générale des Activités Economique dans les Communautés Européennes (NACE). The SBI 1993 is on 4-digit level similar to the NACE. In the lower 5-digit level it contains specific additions, especially adapted to the Dutch situation.

The classifications of industrial activities in the chapter Output, consumption and generation of income deviates at several points from the one used in the ESA 1995. The relation between the Dutch National accounts and the ESA 1995 (A60) is shown in table 1. The ESA 1995 classifications A3, A6, A17 and A30 are actually aggregates of the A60-classification.

Table 1. Relation between the industry classification of the Dutch National accounts and the ESA 1995

National accounts, Chapter Output, consumption and generation of income	ESA 1995, A60	Code NACE Rev. 1	
Agriculture, forestry and fishing	Agriculture, hunting and related service activities	01	
	Forestry, logging and related service activities	02	
	Fishing, operation of fish hatcheries and fish farms; service activities incidental to fishing	05	
Mining and quarrying	Mining of coal and lignite; extraction of peat	10	
	Extraction of crude petroleum and natural gas; service activities incidental to oil and gas extraction excluding surveying	11	
	Mining of uranium and thorium ores	12	
	Mining of metal ores	13	
	Other mining and quarrying	14	
Manufacturing	Manufacture of food products and beverages	15	
	Manufacture of tobacco products	16	
	Manufacture of textile and leather products	17	
		Manufacture of wearing apparel; dressing and dyeing of fur	18
		Tanning and dressing of leather; manufacture of luggage, handbags, saddlery, harness and footwear	19
	Manufacture of paper and paper products	Manufacture of pulp, paper and paper products	21
	Publishing and printing	Publishing, printing and reproduction of recorded media	22
	Manufacture of petroleum products	Manufacture of coke, refined petroleum products and nuclear fuel	23
	Manufacture of basic chemicals	Manufacture of chemicals and chemical products	24
	Manufacture of chemical products		
	Manufacture of rubber and plastic products	Manufacture of rubber and plastic products	25
	Manufacture of basic metals	Manufacture of basic metals	27
	Manufacture of fabricated metal products	Manufacture of fabricated metal product, except machinery and equipment	28
	Manufacture of machinery and equipment n.e.c.	Manufacture of machinery and equipment n.e.c.	29
	Manufacture of electrical and optical equipment	Manufacture of office machinery and computers	30
		Manufacture of electrical machinery and apparatus n.e.c.	31
		Manufacture of radio, television and communication equipment and apparatus	32
		Manufacture of medical, precision and optical instruments, watches and clocks	33
	Manufacture of transport equipment	Manufacture of motor vehicles, trailers and semi-trailers	34
		Manufacture of other transport equipment	35
Other manufacturing	Manufacture of wood and of products of wood and cork, except furniture; manufacture of articles of straw and plaiting materials	20	
	Manufacture of non-metallic mineral products	26	
	Manufacture of furniture; manufacturing n.e.c.	36	
	Recycling	37	
Electricity, gas and water supply	Electricity, gas, steam and hot water supply	40

Some other CBS-publications

Nationale rekeningen 2005 (Dutch edition of the 'National accounts of the Netherlands 2005')

This publication gives a complete survey of the development of the Dutch economy and contains detailed data on product groups, industrial activities and sectors for the years 2001-2004. The publication has been divided in several chapters and closes with explanations and annexes.

Annual, 250 pp., € 45.50.

ISBN-10: 90-357-1649-3. ISBN-13: 978-90-357-1649-0.

ISSN 0168-3489. Key figure P-2.

Nationale rekeningen 2004 – Revisie 2001 Beschrijving en uitkomsten revisiejaar 2001 (Dutch edition)

The national accounts have been revised. This publication gives a detailed description of the revision for the reporting year 2001. The differences between before and after revision are explained. The set-up of the publication is the same as the National accounts for the Netherlands 2004.

94 pp., € 8.70.

ISBN 90-357-2976-5. Key figure P-37.

The Business Cycle in the Netherlands

In the publication "The Business Cycle in the Netherlands" a detailed, consistent survey is given of recent developments of the Dutch economy, based on many data on the business cycle of Statistic Netherlands. The connection is reached by - among other things - using the results of the Quarterly Accounts, which show a systematic description of the economy.

Quarterly, about 60 pp., € 48.40 per annum.

ISSN 1566-3191. Key figure P-104.

The Dutch Economy 2005 (Dutch edition)

Through this publication Statistic Netherlands aims to sketch an actual, broad and consistent survey of recent socioeconomic developments in the Netherlands. The results of the publication National accounts of the Netherlands 2005 have been incorporated. Items like macroeconomic surveys, labour, population, welfare, regional and modules of the national accounts can be found there. Also attention is paid to a comparison between the Netherlands and other EU-countries, the USA and Japan.

Annual, about 200 pp., € 15.60.

ISBN-10: 90-357-1756-2. ISBN-13: 978-90-357-1756-5.

ISSN 1386-1042. Key figure P-19 (to be published in September 2006).

Regional National accounts

For a number of macro-economic variables, such as value added, labour input and fixed capital formation, Statistics Netherlands also compiles a regional break-down. Furthermore, a number of transactions of the income account of the sector households is broken down into regional figures as well. This regional information is published in StatLine under the heading 'Regional National Accounts', which can be found in section 'Economy, prices and government finance'.

Statistical Bulletin (Dutch edition)

The Statistical Bulletin is published weekly on the internet site of Statistics Netherlands (www.cbs.nl) and contains the most recent information of Statistics Netherlands presented in tables, graphs and text.

Weekly, about 10 pp., free e-mail-abonnement.

Statistical Yearbook of the Netherlands 2006

This publication provides you with actual figures on nearly all aspects of the Dutch society. We find there items like population, health, education, unemployment, macroeconomics, agriculture, construction, manufacturing, trade and environment.

Annual, 227 pp., € 18.50.

ISBN-10: 90-357-1621-3. ISBN-13: 978-90-357-1621-6.

ISSN 0303-6448. Key figure A-3.

Internet

The Statistics Netherlands-website can be accessed through www.cbs.nl. The site contains statistical key figures and publications on the Dutch society. Recent statistical results can be found in press releases and bulletins, which can be downloaded.

StatLine

StatLine is the free electronic databank of Statistics Netherlands. StatLine provides statistical information in the shape of tables texts and graphs. All results can be studied, printed or exported. StatLine provides you also with time series on a variety of social and economic items. StatLine can be found on the website www.cbs.nl (see also the chapter 'Figures in StatLine' in the publication National accounts of the Netherlands 2005).

For a complete list of publications, see www.cbs.nl.
